ADuM120N/ADuM121N

3.0 kV rms, Dual-Channel Digital Isolators

FEATURES

- High common-mode transient immunity: 100 kV/µs typical
- High robustness to radiated and conducted noise
- Low propagation delay
  - 13 ns maximum for 5 V operation
  - 15 ns maximum for 1.8 V operation
- 150 Mbps minimum data rate
- Safety and regulatory approvals
  - UL 1577
    - V_{ISO} = 3000 V rms for 1 minute
  - IEC/CSA 62368-1
  - IEC/CSA 60601-1
  - IEC/CSA 61010-1
  - CQC GB4943.1
  - DIN EN IEC 60747-17 (VDE 0884-17)
    - V_{IORM} = 565 V peak
- Backward compatibility
  - ADuM120N0 pin-compatible with ADuM1285
  - ADuM120N1 pin-compatible with ADuM1280 and ADuM1200
  - ADuM121N0 pin-compatible with ADuM1286
  - ADuM121N1 pin-compatible with ADuM1281 and ADuM1201
- Low dynamic power consumption
- 1.8 V to 5 V level translation
- High temperature operation: 125°C
- Fail-safe high or low options
- 8-lead, RoHS-compliant, SOIC package
- AEC-Q100 qualified for automotive applications

APPLICATIONS

- General-purpose multichannel isolation
- Industrial field bus isolation

FUNCTIONAL BLOCK DIAGRAMS

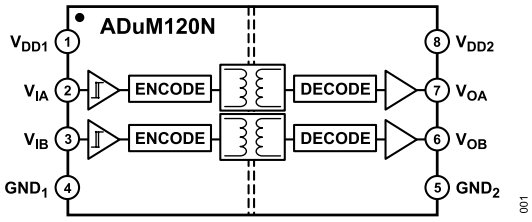

Figure 1. ADuM120N Functional Block Diagram

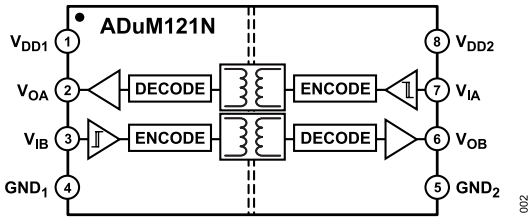

Figure 2. ADuM121N Functional Block Diagram

GENERAL DESCRIPTION

The ADuM120N/ADuM121N[1] are dual-channel digital isolators based on Analog Devices, Inc., *i*Coupler® technology. Combining high speed, complementary metal-oxide semiconductor (CMOS) and monolithic air core transformer technology, these isolation components provide outstanding performance characteristics superior to alternatives such as optocoupler devices and other integrated couplers. The maximum propagation delay is 13 ns with a pulse width distortion of less than 3 ns at 5 V operation. Channel matching is tight at 3.0 ns maximum.

The ADuM120N/ADuM121N data channels are independent and are available in a variety of configurations with a withstand voltage rating of 3 kV rms (see the Ordering Guide). The devices operate with the supply voltage on either side ranging from 1.8 V to 5 V, providing compatibility with lower voltage systems as well as enabling voltage translation functionality across the isolation barrier.

Unlike other optocoupler alternatives, dc correctness is ensured in the absence of input logic transitions. Two different fail-safe options are available in which the outputs transition to a predetermined state when the input power supply is not applied or the inputs are disabled.

The ADuM120N0 is pin-compatible with the ADuM1285, and the ADuM120N1 is pin-compatible with the ADuM1280 and the ADuM1200. The ADuM121N0 is pin-compatible with ADuM1286, and the ADuM121N1 is pin-compatible with the ADuM1281 and the ADuM1201.

SPECIFICATIONS

ELECTRICAL CHARACTERISTICS—5 V OPERATION

All typical specifications are at T_A = 25°C, V_{DD1} = V_{DD2} = 5 V. Minimum/maximum specifications apply over the entire recommended operation range of 4.5 V ≤ V_{DD1} ≤ 5.5 V, 4.5 V ≤ V_{DD2} ≤ 5.5 V, and −40°C ≤ T_A ≤ +125°C, unless otherwise noted. Switching specifications are tested with C_L = 15 pF and CMOS signal levels, unless otherwise noted. Supply currents are specified with 50% duty cycle signals.

Table 1.

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
SWITCHING SPECIFICATIONS						
Pulse Width	PW	6.6			ns	Within pulse width distortion (PWD) limit
Data Rate		150			Mbps	Within PWD limit
Propagation Delay	t_{PHL}, t_{PLH}	4.8	7.2	13	ns	50% input to 50% output
Pulse Width Distortion	PWD		0.5	3	ns	$\lvert t_{PLH} - t_{PHL} \rvert$
Change vs. Temperature			1.5		ps/°C

Table 1. (Continued)

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
	$\lvert CM_L \rvert$	75	100		kV/µs	V_{Ix} = 0 V, V_{CM} = 1000 V, transient magnitude = 800 V

[1] I_{Ox} is the Channel x output current, where x = A or B.

[2] V_{IxH} is the input side logic high voltage.

[3] V_{IxL} is the input side logic low voltage.

[4] V_I is the input voltage.

[5] N0 is the ADuM120N0/ADuM121N0 models, and N1 is the ADuM120N1/ADuM121N1 models. See the Ordering Guide.

[6] $\lvert CM_H \rvert$ is the maximum common-mode voltage slew rate that can be sustained while maintaining the voltage output (V_O) > 0.8 V_{DDx}. $\lvert CM_L \rvert$ is the maximum common-mode voltage slew rate that can be sustained while maintaining V_O > 0.8 V. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.

Table 2. Total Supply Current vs. Data Throughput

		1 Mbps			25 Mbps			100 Mbps			
Parameter	Symbol	Min	Typ	Max	Min	Typ	Max	Min	Typ	Max	Unit

ELECTRICAL CHARACTERISTICS—3.3 V OPERATION

All typical specifications are at T_A = 25°C, V_{DD1} = V_{DD2} = 3.3 V. Minimum/maximum specifications apply over the entire recommended operation range: 3.0 V ≤ V_{DD1} ≤ 3.6 V, 3.0 V ≤ V_{DD2} ≤ 3.6 V, and −40°C ≤ T_A ≤ +125°C, unless otherwise noted. Switching specifications are tested with C_L = 15 pF and CMOS signal levels, unless otherwise noted. Supply currents are specified with 50% duty cycle signals.

Common-Mode Transient Immunity[6]	$\|CM_H\|$	75	100		kV/µs	V_{Ix} = V_{DDx}, V_{CM} = 1000 V, transient magnitude = 800 V
	$\|CM_L\|$	75	100		kV/µs	V_{Ix} = 0 V, V_{CM} = 1000 V, transient magnitude = 800 V

[1] I_{Ox} is the Channel x output current, where x = A or B.

[2] V_{IxH} is the input side logic high voltage.

[3] V_{IxL} is the input side logic low voltage.

[4] V_I is the input voltage.

[5] N0 is the ADuM120N0/ADuM121N0 models, N1 is the ADuM120N1/ADuM121N1 models. See the Ordering Guide.

[6] $|CM_H|$ is the maximum common-mode voltage slew rate that can be sustained while maintaining V_O > 0.8 V_{DDx}. $|CM_L|$ is the maximum common-mode voltage slew rate that can be sustained while maintaining V_O > 0.8 V. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.

SPECIFICATIONS

RECOMMENDED OPERATING CONDITIONS

Table 13.

Parameter	Symbol	Rating
Operating Temperature	T_A	−40°C to +125°C
Supply Voltages	V_{DD1}, V_{DD2}	1.7 V to 5.5 V
Input Signal Rise and Fall Times		1.0 ms

ABSOLUTE MAXIMUM RATINGS

T_A = 25°C, unless otherwise noted.

Table 14.

Parameter	Rating
Supply Voltages (V_{DD1}, V_{DD2})	−0.5 V to +7.0 V
Input Voltages (V_{IA}, V_{IB})[1]	−0.5 V to V_{DDI} + 0.5 V
Output Voltages (V_{OA}, V_{OB})[2]	−0.5 V to V_{DDO} + 0.5 V
Average Output Current per Pin[3]	
Side 1 Output Current (I_{O1})	−10 mA to +10 mA
Side 2 Output Current (I_{O2})	−10 mA to +10 mA
Common-Mode Transients[4]	−150 kV/µs to +150 kV/µs
Storage Temperature (T_{ST}) Range	−65°C to +150°C
Ambient Operating Temperature (T_A) Range	−40°C to +125°C

[1] V_{DDI} is the input side supply voltage.

[2] V_{DDO} is the output side supply voltage.

[3] See Figure 3 for the maximum rated current values for various temperatures.

[4] Common-mode transients refer to the common-mode transients across the insulation barrier. Common-mode transients exceeding the absolute maximum ratings can cause latch-up or permanent damage.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

TRUTH TABLES

Table 15. ADuM120N/ADuM121N Truth Table (Positive Logic)

V_{Ix} Input[1]	V_{DDI} State[1]	V_{DDO} State[1]	Default Low (N0), V_{Ox} Output[1, 2]	Default High (N1), V_{Ox} Output[1, 2]	Test Conditions/Comments
Low	Powered	Powered	Low	Low	Normal operation
High	Powered	Powered	High	High	Normal operation
Don't Care[3]	Unpowered	Powered	Low	High	Fail-safe output
Don't Care[3]	Powered	Unpowered	Indeterminate	Indeterminate	

[1] V_{Ix} and V_{Ox} refer to the input and output signals of a given channel (A or B). V_{DDI} and V_{DDO} refer to the supply voltages on the input and output sides of the given channel, respectively.

[2] N0 is the ADuM120N0/ADuM121N0 models, N1 is the ADuM120N1/ADuM121N1 models. See the Ordering Guide.

[3] Input pins (V_{Ix}) on the same side as an unpowered supply must be in a low state to avoid powering the device through the ESD protection circuitry.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

APPLICATIONS INFORMATION

OVERVIEW

The ADuM120N/ADuM121N use a high frequency carrier to transmit data across an isolation barrier using iCoupler chip scale transformer coils separated by layers of polyimide isolation. With an on/off keying (OOK) technique and the differential architecture shown in Figure 13 and Figure 14, the ADuM120N/ADuM121N have very low propagation delay and high speed. Internal regulators and input/output design techniques allow logic and supply voltages over a wide range from 1.7 V to 5.5 V, offering voltage translation of 1.8 V, 2.5 V, 3.3 V, and 5 V logic. The architecture is designed for high common-mode transient immunity and high immunity to electrical noise and magnetic interference. Radiated emissions are minimized with a spread spectrum OOK carrier and other techniques.

Figure 13 shows the operation block diagram of a single channel for the ADuM120N0/ADuM121N0 models, which have the condition of the fail-safe output state equal to low, where the carrier waveform is off when the input state is low. If the input side is off or not operating, the fail-safe output state of low (noted by the 0 in the model number) sets the output to low. For the ADuM120N1/ADuM120N1, which have a fail-safe output state of high, Figure 14 shows the conditions where the carrier waveform is off when the input state is high. When the input side is off or not operating, the fail-safe output state of high (noted by the 1 in the model number) sets the output to high. See the Ordering Guide for the model numbers that have the fail-safe output state of low or the fail-safe output state of high.

PCB LAYOUT

The ADuM120N/ADuM121N digital isolators require no external interface circuitry for the logic interfaces. Power supply bypassing is strongly recommended at the input and output supply pins (see Figure 12). Bypass capacitors are most conveniently connected between Pin 1 and Pin 4 for V_{DD1} and between Pin 5 and Pin 8 for V_{DD2}. The recommended bypass capacitor value is between 0.01 µF and 0.1 µF. The total lead length between both ends of the capacitor and the input power supply pin must not exceed 10 mm.

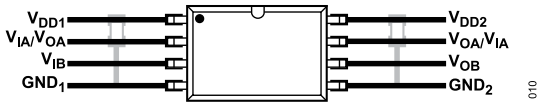

Figure 12. Recommended Printed Circuit Board Layout

In applications involving high common-mode transients, ensure that board coupling across the isolation barrier is minimized. Furthermore, design the board layout such that any coupling that does occur equally affects all pins on a given component side. Failure to ensure this can cause voltage differentials between pins exceeding the Absolute Maximum Ratings of the device, thereby leading to latch-up or permanent damage.

See the AN-1109 Application Note for board layout guidelines.

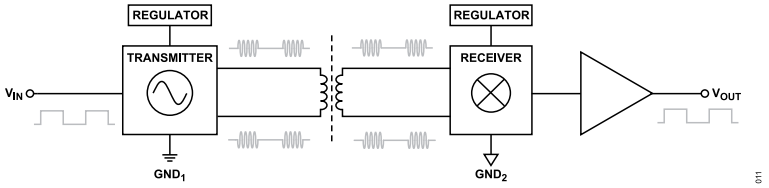

Figure 13. Operational Block Diagram of a Single Channel with a Low Fail-Safe Output State

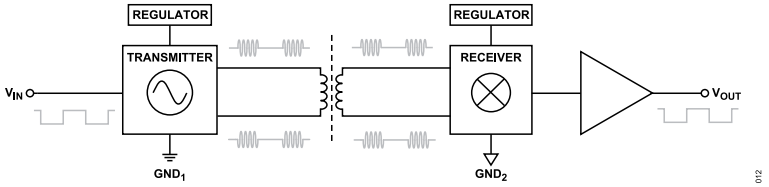

Figure 14. Operational Block Diagram of a Single Channel with a High Fail-Safe Output State

APPLICATIONS INFORMATION

PROPAGATION DELAY RELATED PARAMETERS

Propagation delay is a parameter that describes the time it takes a logic signal to propagate through a component. The propagation delay to a Logic 0 output can differ from the propagation delay to a Logic 1 output.

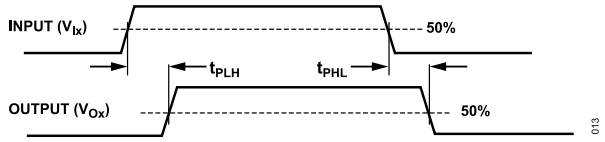

Figure 15. Propagation Delay Parameters

Pulse width distortion is the maximum difference between these two propagation delay values and is an indication of how accurately the timing of the input signal is preserved.

Channel matching is the maximum amount the propagation delay differs between channels within a single ADuM120N/ADuM121N component.

Propagation delay skew is the maximum amount the propagation delay differs between multiple ADuM120N/ADuM121N components operating under the same conditions

JITTER MEASUREMENT

Figure 16 shows the eye diagram for the ADuM120N/ADuM121N. The measurement was taken using an Agilent 81110A pulse pattern generator at 150 Mbps with pseudorandom bit sequences (PRBS) 2(n − 1), n = 14, for 5 V supplies. Jitter was measured with the Tektronix Model 5104B oscilloscope, 1 GHz, 10 GS/s with the DPOJET jitter and eye diagram analysis tools. The result shows a typical measurement on the ADuM120N/ADuM121N with 380 ps p-p jitter.

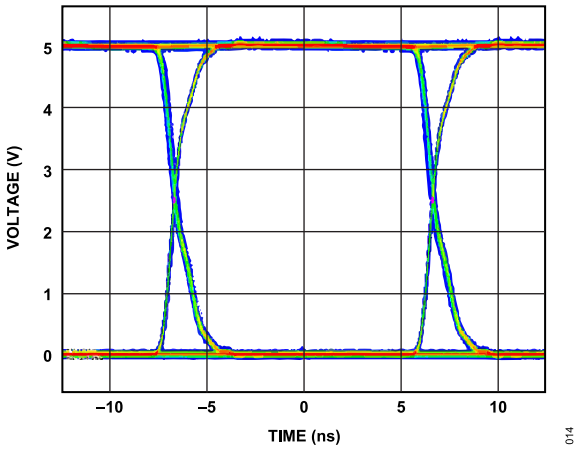

Figure 16. ADuM120N/ADuM121N Eye Diagram

AUTOMOTIVE PRODUCTS

TheADuM121N1WBRZ and the ADuM121N1WBRZ-RL7 models are available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that these automotive models may have specifications that differ from the commercial models; therefore, designers should review the Specifications section of this data sheet carefully. Only the automotive grade products shown are available for use in automotive applications. Contact your local Analog Devices account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.
