ispLSI® 2032VE

3.3V In-System Programmable High Density SuperFAST™ PLD

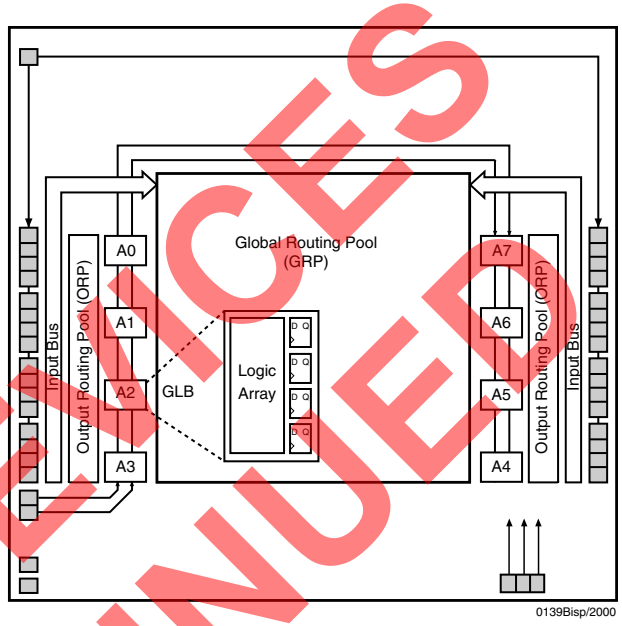

Lead-Free Package Options Available!

SELECT DEVICES DISCONTINUED

Features

- **SuperFAST HIGH DENSITY IN-SYSTEM PROGRAMMABLE LOGIC**
  - 1000 PLD Gates
  - 32 I/O Pins, Two Dedicated Inputs
  - 32 Registers
  - High Speed Global Interconnect
  - Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
  - Small Logic Block Size for Random Logic
  - 100% Functional, JEDEC and Pinout Compatible with ispLSI 2032V Devices
- **3.3V LOW VOLTAGE 2032 ARCHITECTURE**
  - Interfaces With Standard 5V TTL Devices
- **HIGH PERFORMANCE E²CMOS® TECHNOLOGY**
  - f_{max} = 300 MHz Maximum Operating Frequency
  - t_{pd} = 3.0 ns Propagation Delay
  - Electrically Erasable and Reprogrammable
  - Non-Volatile
  - 100% Tested at Time of Manufacture
  - Unused Product Term Shutdown Saves Power
- **IN-SYSTEM PROGRAMMABLE**
  - 3.3V In-System Programmability Using Boundary Scan Test Access Port (TAP)
  - Open-Drain Output Option for Flexible Bus Interface Capability, Allowing Easy Implementation of Wired-OR or Bus Arbitration Logic
  - Increased Manufacturing Yields, Reduced Time-to-Market and Improved Product Quality
  - Reprogram Soldered Devices for Faster Prototyping
- **100% IEEE 1149.1 BOUNDARY SCAN TESTABLE**
- **THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FPGAs**
  - Enhanced Pin Locking Capability
  - Three Dedicated Clock Input Pins
  - Synchronous and Asynchronous Clocks
  - Programmable Output Slew Rate Control
  - Flexible Pin Placement
  - Optimized Global Routing Pool Provides Global Interconnectivity
  - Lead-Free Package Options

Functional Block Diagram

Description

The ispLSI 2032VE is a High Density Programmable Logic Device that can be used in both 3.3V and 5V systems. The device contains 32 Registers, 32 Universal I/O pins, two Dedicated Input Pins, three Dedicated Clock Input Pins, one dedicated Global OE input pin and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 2032VE features in-system programmability through the Boundary Scan Test Access Port (TAP) and is 100% IEEE 1149.1 Boundary Scan Testable. The ispLSI 2032VE offers non-volatile reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems.

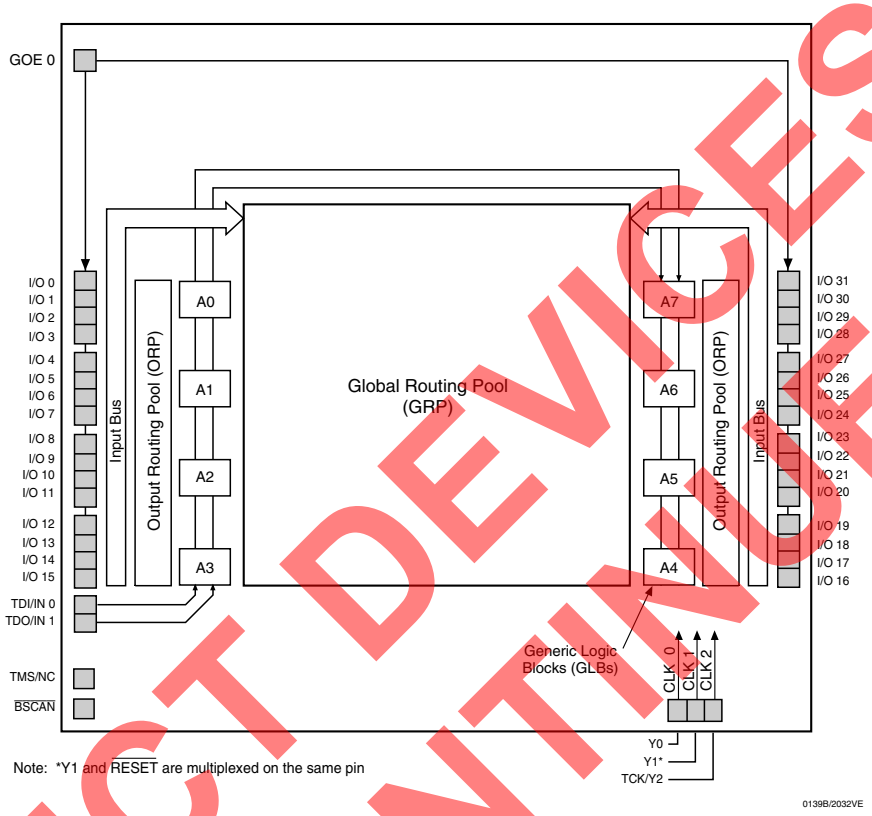

The basic unit of logic on the ispLSI 2032VE device is the Generic Logic Block (GLB). The GLBs are labeled A0, A1 .. A7 (see Figure 1). There are a total of eight GLBs in the ispLSI 2032VE device. Each GLB is made up of four macrocells. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any GLB on the device.

Functional Block Diagram

Figure 1. ispLSI 2032VE Functional Block Diagram

The device also has 32 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, output or bi-directional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise. Device pins can be safely driven to 5 Volt signal levels to support mixed-voltage systems.

Eight GLBs, 32 I/O cells, two dedicated inputs and two ORPs are connected together to make a Megablock (see Figure 1). The outputs of the eight GLBs are connected to a set of 32 universal I/O cells by the ORPs. Each ispLSI 2032VE device contains one Megablock.

The GRP has as its inputs the outputs from all of the GLBs and all of the inputs from the bi-directional I/O cells. All of these signals are made available to the inputs of the GLBs. Delays through the GRP have been equalized to minimize timing skew.

Clocks in the ispLSI 2032VE device are selected using the dedicated clock pins. Three dedicated clock pins (Y0, Y1, Y2) or an asynchronous clock can be selected on a GLB basis. The asynchronous or Product Term clock can be generated in any GLB for its own clock.

Programmable Open-Drain Outputs

In addition to the standard output configuration, the outputs of the ispLSI 2032VE are individually programmable, either as a standard totem-pole output or an open-drain output. The totem-pole output drives the specified Voh and Vol levels, whereas the open-drain output drives only the specified Vol. The Voh level on the open-drain output depends on the external loading and pull-up. This output configuration is controlled by a programmable fuse. The default configuration when the device is in bulk erased state is the totem-pole configuration. The open-drain/totem-pole option is selectable through the Lattice design tools.

Absolute Maximum Ratings [1]

Supply Voltage V_{cc} ..... -0.5 to +5.4V

Input Voltage Applied..... -0.5 to +5.6V

Off-State Output Voltage Applied ..... -0.5 to +5.6V

Storage Temperature..... -65 to +150°C

Case Temp. with Power Applied ..... -55 to 125°C

Max. Junction Temp. (T_J) with Power Applied ... 150°C

1. Stresses above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

DC Recommended Operating Condition

SYMBOL	PARAMETER		MIN.	MAX.	UNITS
V_{CC}	Supply Voltage	Commercial T_A = 0°C to + 70°C	3.0	3.6	V
		Industrial T_A = -40°C to + 85°C	3.0	3.6	V
V_{IL}	Input Low Voltage		V_{SS} – 0.5	0.8	V
V_{IH}	Input High Voltage		2.0	5.25	V

Table 2-0005/2032VE

Capacitance (T_A=25°C, f=1.0 MHz)

SYMBOL	PARAMETER	TYPICAL	UNITS	TEST CONDITIONS
C_1	Dedicated Input Capacitance	8	pf	V_{CC} = 3.3V, V_{IN} = 0.0V
C_2	I/O Capacitance	6	pf	V_{CC} = 3.3V, $V_{I/O}$ = 0.0V
C_3	Clock Capacitance	10	pf	V_{CC} = 3.3V, V_Y = 0.0V

Table 2-0006/2032VE

Erase Reprogram Specifications

PARAMETER	MINIMUM	MAXIMUM	UNITS
Erase/Reprogram Cycles	10,000	–	Cycles

SELECT DEVICES DISCONTINUED

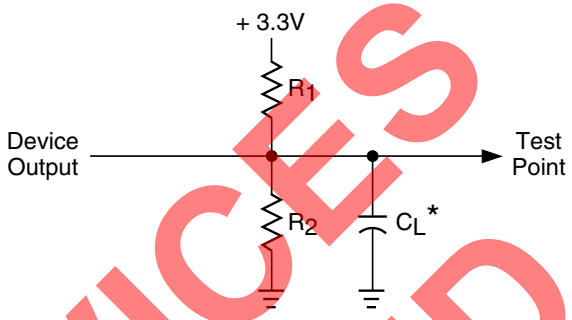

Switching Test Conditions

Input Pulse Levels	GND to 3.0V
Input Rise and Fall Time 10% to 90%	≤ 1.5 ns
Input Timing Reference Levels	1.5V
Output Timing Reference Levels	1.5V
Output Load	See Figure 2

Table 2-0003/2032VE

3-state levels are measured 0.5V from steady-state active level.

Figure 2. Test Load

*C_L includes Test Fixture and Probe Capacitance.

0213A/2032VE

Output Load Conditions (see Figure 2)

TEST CONDITION		R1	R2	CL
A		316Ω	348Ω	35pF
B	Active High	∞	348Ω	35pF
	Active Low	316Ω	348Ω	35pF
C	Active High to Z at V_{OH}-0.5V	∞	348Ω	5pF
	Active Low to Z at V_{OL}+0.5V	316Ω	348Ω	5pF

Table 2-0004A/2032VE

DC Electrical Characteristics

Over Recommended Operating Conditions

SYMBOL	PARAMETER	CONDITION		MIN.	TYP.[3]	MAX.	UNITS
V_{OL}	Output Low Voltage	I_{OL} = 8 mA		–	–	0.4	V
V_{OH}	Output High Voltage	I_{OH} = -4 mA		2.4	–	–	V
I_{IL}	Input or I/O Low Leakage Current	0V ≤ V_{IN} ≤ V_{IL} (Max.)		–	–	-10	µA
I_{IH}	Input or I/O High Leakage Current	(V_{CC} - 0.2)V ≤ V_{IN} ≤ V_{CC}		–	–	10	µA
		V_{CC} ≤ V_{IN} ≤ 5.25V		–	–	10	µA
I_{IL-isp}	$\overline{BSCAN}$ Input Low Leakage Current	0V ≤ V_{IN} ≤ V_{IL}		–	–	-150	µA
I_{IL-PU}	I/O Active Pull-Up Current	0V ≤ V_{IN} ≤ V_{IL}		–	–	-150	µA
I_{OS}[1]	Output Short Circuit Current	V_{CC} = 3.3V, V_{OUT} = 0.5V		–	–	-100	mA
I_{CC}[2, 4, 5]	Operating Power Supply Current	V_{IL} = 0.0V, V_{IH} = 3.0V, f_{CLOCK} = 1MHz	-300/-225	–	80	–	mA
			Others	–	65	–	mA

Table 2-0007/2032VE

1. One output at a time for a maximum duration of one second. V_{OUT} = 0.5V was selected to avoid test problems by tester ground degradation. Characterized but not 100% tested.
2. Measured using two 16-bit counters.
3. Typical values are at V_{CC} = 3.3V and T_A = 25°C.
4. Maximum I_{CC} varies widely with specific device configuration and operating frequency. Refer to Power Consumption section of this data sheet and Thermal Management section of the Lattice Semiconductor Data Book or CD-ROM to estimate maximum I_{CC}.
5. Unused inputs at V_{IL} = 0V.

Power Consumption

Power consumption in the ispLSI 2032VE device depends on two primary factors: the speed at which the device is operating and the number of product terms used. Figure 3 shows the relationship between power and operating speed.

Figure 3. Typical Device Power Consumption vs fmax

Notes: Configuration of two 16-bit counters
Typical current at 3.3V, 25° C

I_{CC} can be estimated for the ispLSI 2032VE using the following equation:

For ispLSI 2032VE-300 and -225: I_{CC}(mA) = 4.5 + (# of PTs * 1.29) + (# of nets * Fmax * 0.0068)

For ispLSI 2032VE-180 and slower: I_{CC}(mA) = 4.5 + (# of PTs * 1.05) + (# of nets * Fmax * 0.0068)

Where:
# of PTs = Number of product terms used in design
# of nets = Number of signals used in device
Max freq = Highest clock frequency to the device (in MHz)

The I_{CC} estimate is based on typical conditions (V_{CC} = 3.3V, room temperature) and an assumption of two GLB loads on average exists. These values are for estimates only. Since the value of I_{CC} is sensitive to operating conditions and the program in the device, the actual I_{CC} should be verified.

0127A/2032VE

Signal Descriptions

Signal Name	Description
GOE 0	Global Output Enable input pin
Y0	Dedicated Clock input. This clock input is connected to one of the clock inputs of all the GLBs in the device.
$\overline{\text{RESET}}$/Y1	This pin performs two functions: (1) Active Low (0) Reset pin which resets all of the registers in the device. (2) Dedicated Clock input.
$\overline{\text{BSCAN}}$	Input – Dedicated in-system programming Boundary Scan enable input pin. This pin is brought low to enable the programming mode. The TMS, TDI, TDO and TCK controls become active.
TDI/IN 0	Input – This pin performs two functions. (1) When $\overline{\text{BSCAN}}$ is logic low, it functions as a serial data input pin to load programming data into the device. (2) When BSCAN is high, it functions as a dedicated input pin.
TMS/NC[1]	Input – This pin performs two functions. (1) When BSCAN is logic low, it functions as a mode control pin for the Boundary Scan state machine. (2) When BSCAN is high, this pin is not to be connected to any active signals, VCC or GND.
TDO/IN 1	Output/Input – This pin performs two functions. (1) When $\overline{\text{BSCAN}}$ is logic low, it functions as an output pin to read serial shift register data. (2) When $\overline{\text{BSCAN}}$ is high, it functions as a dedicated input pin.
TCK/Y2	Input – This pin performs two functions. (1) When $\overline{\text{BSCAN}}$ is logic low, it functions as a clock pin for the Boundary Scan state machine. (2) When $\overline{\text{BSCAN}}$ is high, it functions as a Dedicated Clock input.
GND	Ground (GND)
VCC	Vcc
NC[1]	No Connect
I/O	Input/Output pins – These are the general purpose I/O pins used by the logic array.
