TPS61099x Synchronous Boost Converter With Ultra-Low Quiescent Current

1 Features

- 600nA ultra-low I_Q into V_{OUT} pin
- 400nA ultra-low I_Q into V_{IN} pin
- Operating input voltage from 0.7V to 5.5V
- Adjustable output voltage from 1.8V to 5.5V
- Fixed output voltage versions available
- Minimum 0.8A switch peak current limit
- Regulated output voltage in down mode
- True disconnection during shutdown
- Up to 75% efficiency at 10µA load with fixed output voltage versions
- Up to 93% efficiency from 10mA to 300mA load
- 6-ball 1.23mm × 0.88mm WCSP package and 2mm × 2mm WSON package
- Create a custom design using the TPS61099x with the WEBENCH® Power Designer

2 Applications

- Memory LCD bias
- Optical heart rate monitor LED bias
- Wearable applications
- Low-power wireless applications
- Portable products
- Battery powered systems

3 Description

The TPS61099x device is a synchronous boost converter with 1µA ultra-low quiescent current. The device is designed for products powered by an alkaline battery, NiMH rechargeable battery, Li-Mn battery, or rechargeable Li-Ion battery where high efficiency under light-load condition is critical to achieve long battery life operation.

The TPS61099x boost converter uses a hysteretic control topology to obtain maximal efficiency at minimal quiescent current. The device only consumes 1µA quiescent current under light-load condition and can achieve up to 75% efficiency at 10µA load with fixed output voltage version. The device can also support up to 300mA output current from 3.3V to 5V conversion, and achieve up to 93% at 200mA load.

The TPS61099x also offers both Down mode and Pass-Through operations for different applications. In Down mode, the output voltage can still be regulated at target value even when input voltage is higher than the output voltage. In Pass-Through mode, the output voltage follows input voltage. The TPS61099x exits Down mode and enters into Pass-Through mode when $V_{IN} > V_{OUT} + 0.5V$.

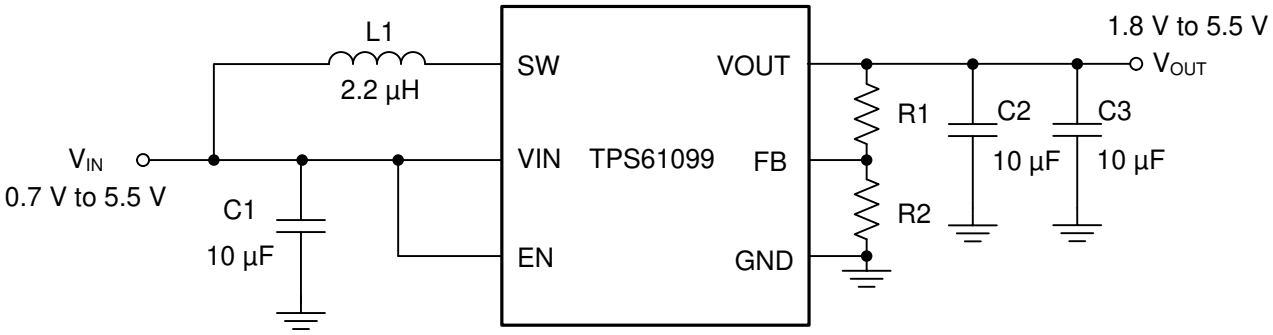

The TPS61099x supports true shutdown function when disabled, which disconnects the load from the input supply to reduce the current consumption.

The TPS61099x offers both adjustable output voltage version and fixed output voltage versions. The device is available in a 6-ball 1.23mm × 0.88mm WCSP Package and a 6-pin 2mm × 2mm WSON package.

Package Information

PART NUMBER	PACKAGE(1)	PACKAGE SIZE(2)
TPS61099	YFF (DSBGA, 6)	1.23mm × 0.88mm
	DRV (WSON, 6)	2mm × 2mm

(1) For more information, see Section 11.
(2) The package size (length × width) is a nominal value and includes pins, where applicable.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
Voltage range at terminals(2)	VIN, SW, VOUT, FB, EN	-0.3	6.0	V
Operating junction temperature, T_J		–40	150	°C
Storage temperature range, T_{stg}		–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to network ground terminal.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human Body Model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	±2000	V
		Charged Device Model (CDM), per JEDEC specification JESD22C101, all pins(2)	±500	

(1) JEDEC document JEP155 states that 500V HBM rating allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250V CDM rating allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V_{IN}	Input voltage range	0.7		5.5	V
V_{OUT}	Output voltage range	1.8		5.5	V
L	Inductor	0.7	2.2	2.86	µH
C_{IN}	Input capacitor	1.0	10		µF
C_{OUT}	Output capacitor	10	20	100	µF
T_J	Operating virtual junction temperature	–40		125	°C

7 Detailed Description

7.1 Overview

The TPS61099x synchronous step-up converter is designed for alkaline battery, coin-cell battery, Li-ion or Li-polymer battery powered systems, which requires long battery running time and tiny design size. The TPS61099x can operate with a wide input voltage from 0.7V to 5.5V. TPS61099x only consumes 1μA quiescent current and can achieve high efficiency under light load condition.

The TPS61099x operates in a hysteretic control scheme with typical 1A peak switch current limit. The TPS61099x provides the true shutdown function and the load is completely disconnected from the input so as to minimize the leakage current. TPS61099x also adopts down mode and pass-through operation when input voltage is close to or higher than the regulated output voltage. The TPS61099x family is available in both adjustable and fixed output voltage versions. Adjustable version offers programmable output voltage for flexible applications while fixed versions offer minimal design size and achieve up to 75% high efficiency under 10μA load.

7.2 Functional Block Diagram

A. Internal FB resistor divider is implemented in fixed output voltage versions.

7.3 Feature Description

7.3.1 Boost Controller Operation

The TPS61099x boost converter is controlled by a hysteretic current mode controller. This controller regulates the output voltage by keeping the inductor ripple current constant in the range of 300mA and adjusting the offset of this inductor current depending on the output load. Because the input voltage, output voltage and inductor value all affect the rising and falling slopes of inductor ripple current, the switching frequency is not fixed and is determined by the operation condition. If the required average input current is lower than the average inductor current defined by this constant ripple, the inductor current goes discontinuously to keep the efficiency high under light load condition. Figure 7-1 shows the hysteretic current operation. If the load current is reduced further, the boost converter enters into Burst mode. In burst mode, the boost converter ramps up the output voltage with several switching cycles. After the output voltage exceeds a setting threshold, the device stops

Copyright © 2026 Texas Instruments Incorporated

switching and goes into a sleep status. In sleep status, the device consumes less quiescent current. The device resumes switching when the output voltage is below the setting threshold. The device exits the burst mode when the output current can no longer be supported in this mode. Refer to Figure 7-2 for burst mode operation details.

To achieve high efficiency, the power stage is realized as a synchronous boost topology. The output voltage V_{OUT} is monitored through an external or internal feedback network which is connected to the voltage error amplifier. To regulate the output voltage, the voltage error amplifier compares this feedback voltage to the internal voltage reference and adjusts the required offset of the inductor current accordingly.

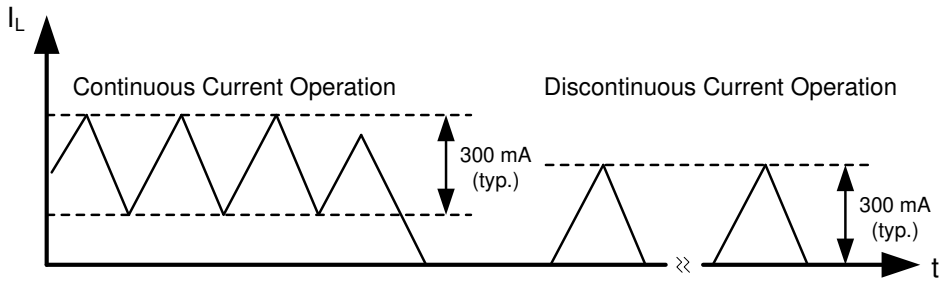

Figure 7-1. Hysteretic Current Operation

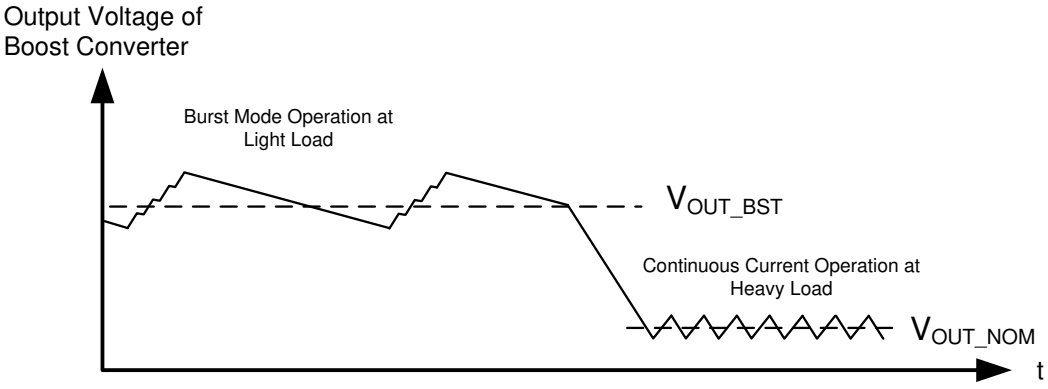

Figure 7-2. Burst Mode Operation

7.3.2 Undervoltage Lockout

An undervoltage lockout (UVLO) circuit stops the operation of the converter when the input voltage drops below the typical UVLO threshold of 0.4V. A hysteresis of 200mV is added so that the device cannot be enabled again until the input voltage goes up to 0.6V. This function is implemented to prevent malfunctioning of the device when the input voltage is between 0.4V and 0.6V.

7.3.3 Enable and Disable

When the input voltage is above UVLO rising threshold and the EN pin is pulled to high voltage, the TPS61099x is enabled. When the EN pin is pulled to low voltage, the TPS61099x goes into shutdown mode. In shutdown mode, the device stops switching and the rectifying PMOS fully turns off, providing the completed disconnection between input and output. Less than 0.5µA input current is consumed in shutdown mode.

7.3.4 Soft Start

After the EN pin is tied to high voltage, the TPS61099x begins to start up. At the beginning, the device operates at the boundary of Discontinuous Conduction Mode (DCM) and Continuous Conduction Mode (CCM), and the inductor peak current is limited to around 200mA during this stage. When the output voltage is charged above approximately 1.6V, the device starts the hysteretic current mode operation. The current limit threshold is gradually increasing to 0.7 × I_{LIM} within 500µs. In this way, the soft-start function reduces the inrush current during start-up. After V_{OUT} reaches the target value, soft start stage ends and the peak current is now

Copyright © 2026 Texas Instruments Incorporated

determined by the output of an internal error amplifier which compares the feedback of the output voltage and the internal reference voltage.

The TPS61099x is able to start up with 0.7V input voltage with larger than 3kΩ load. However, if the load during start-up is so heavy that the TPS61099x fails to charge the output voltage above 1.6V, the TPS61099x cannot start up successfully until the input voltage is increased or the load current is reduced. The start-up time depends on input voltage and load current.

For fixed-output devices, the target output voltage is set through EEPROM. During an EN ON-OFF-ON transition, the EEPROM bits are temporarily cleared to zero before the correct configuration is reloaded. To ensure reliable EEPROM bit restoration, avoid excessively short EN off-periods and keep the EN low-time at least 400µs for any ON-OFF-ON transition.

7.3.5 Current Limit Operation

The TPS61099x employs cycle-by-cycle overcurrent protection (OCP) function. If the inductor peak current reaches the current limit threshold I_{LIM}, the main switch turns off so as to stop further increase of the input current. In this case the output voltage decreases until the power balance between input and output is achieved. If the output drops below the input voltage, the TPS61099x enters into Down Mode. The peak current is still limited by I_{LIM} cycle-by-cycle in down mode. If the output drops below 1.6V, the TPS61099 enters into startup process again. In pass-through operation, current limit function is not enabled.

7.3.6 Output Short-to-Ground Protection

The TPS61099x starts to limit the switch current to 200mA when the output voltage is below 1.6V. If short-to-ground condition occurs, switch current is limited at 200mA. After the short circuit is released, the TPS61099x goes back to soft start again and regulates the output voltage.

7.3.7 Overvoltage Protection

TPS61099x has an output overvoltage protection (OVP) to protect the device in case that the external feedback resistor divider is wrongly populated. When the output voltage of the TPS61099 exceeds the OVP threshold of 5.8V, the device stops switching. After the output voltage falls 0.1V below the OVP threshold, the device starts operating again.

7.3.8 Down Mode Regulation and Pass-Through Operation

The TPS61099x features down mode and pass-through operation when input voltage is close to or higher than output voltage.

In the down mode, output voltage is regulated at target value even when $V_{IN} > V_{OUT}$. The control circuit changes the behavior of the rectifying PMOS by pulling the gate to input voltage instead of to ground. In this way, the voltage drop across the PMOS is increasing as high as to regulate the output voltage. The power loss also increases in this mode, which needs to be taken into account for thermal consideration.

In the Pass-Through operation, the boost converter stops switching. The rectifying PMOS constantly turns on and low side switch constantly turns off. The output voltage is the input voltage minus the voltage drop across the dc resistance (DCR) of the inductor and the on-resistance of the rectifying PMOS.

With V_{IN} ramping up, the TPS61099x goes into down mode first when $V_{IN} > V_{OUT}$ – 50mV. TPS61099x stays in down mode until $V_{IN} > V_{OUT}$ + 0.5V and then goes automatically into pass-through operation. In the pass-through operation, output voltage follows input voltage. The TPS61099x exits pass-through mode and goes back to down mode when V_{IN} ramps down to 103% of the target output voltage. TPS61099x stays in down mode until input voltage falls 100mV below the output voltage, returning to boost operation.

Copyright © 2026 Texas Instruments Incorporated

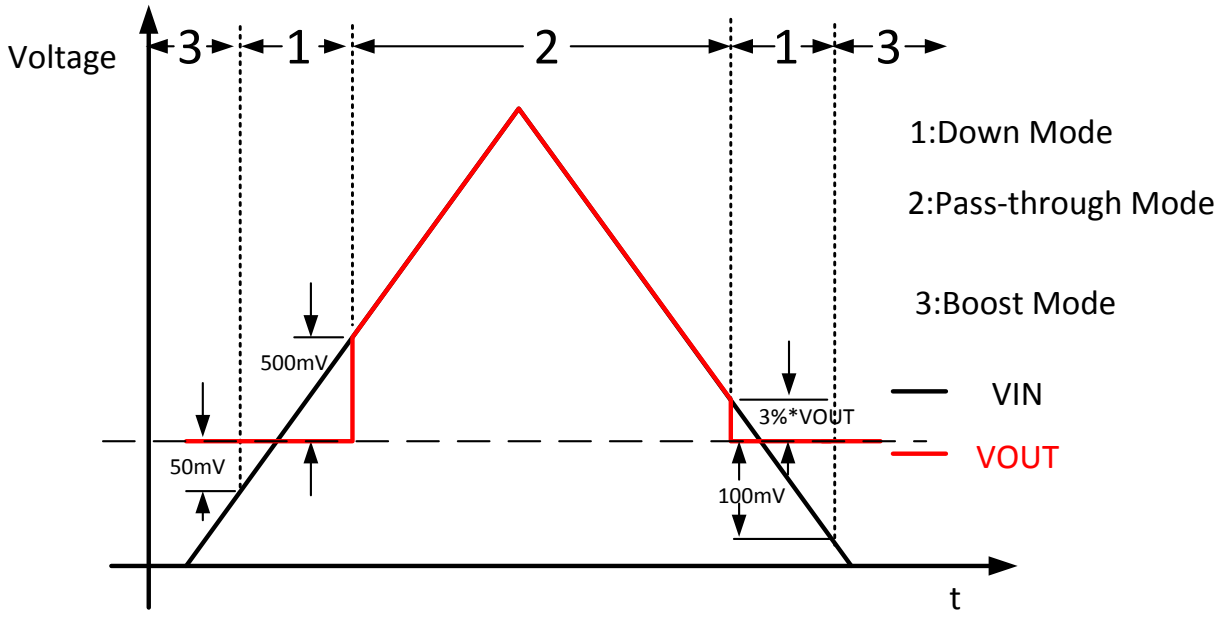

Figure 7-3. Down Mode and Pass-Through Operation

7.3.9 Thermal Shutdown

The TPS61099x has a built-in temperature sensor which monitors the internal junction temperature in boost mode operation. If the junction temperature exceeds the threshold 150°C, the device stops operating. As soon as the junction temperature drops below the shutdown temperature minus the hysteresis, typically 125°C, the device starts operating again.

7.4 Device Functional Modes

7.4.1 Burst Mode Operation under Light Load Condition

The boost converter of TPS61099x enters into Burst Mode operation under light load condition. Refer to *Boost Controller Operation* for details.

7.4.2 Down Mode Regulation and Pass-Through Mode Operation

The boost converter of TPS61099x automatically enters into Down Mode or pass-through mode operation when input voltage is higher than the target output voltage. Refer to *Down Mode Regulation and Pass-Through Operation* for details.

8 Application and Implementation

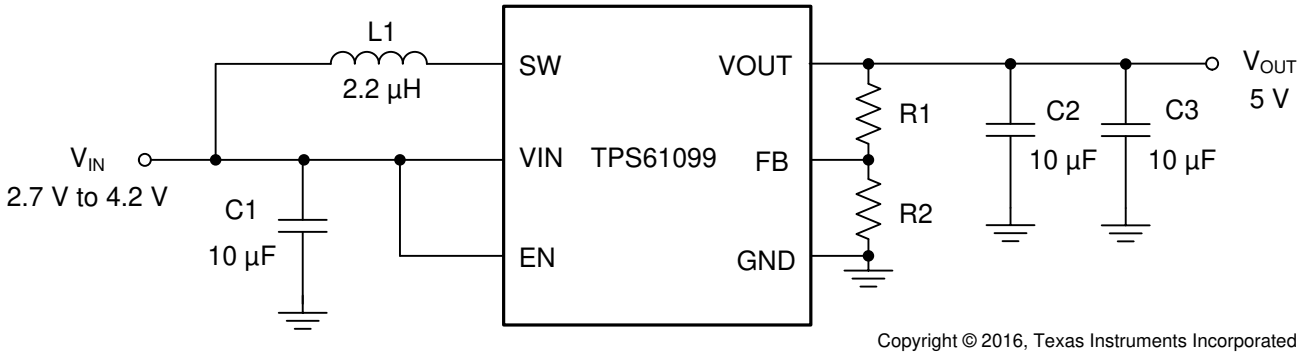

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The TPS61099x is a synchronous boost converter designed to operate at a wide input voltage from 0.7V to 5.5V with 1A peak switch current limit. The device adopts a hysteretic control scheme so the operating frequency is not a constant value, which varies with different input and output voltages and inductor values. The device only consumes 1µA quiescent current under light load condition. The device also supports true shutdown to disconnect the load from the input to minimize the leakage current. Therefore,the device is an excellent choice for alkaline battery, coin-cell battery, Li-ion or Li-polymer battery powered systems to extend the battery running time.

8.2 Typical Application - 5V Output Boost Converter

Copyright © 2016, Texas Instruments Incorporated

8.2.1 Design Requirements

A typical application example is the memory LCD, which normally requires 5V output as the bias voltage and only consumes less than 1mA current. The following design procedure can be used to select external component values for the TPS61099x.

Table 8-1. Design Requirements

PARAMETERS	VALUES
Input voltage	2.7V to approximately 4.2V
Output voltage	5V
Output current	1mA
Output voltage ripple	± 50mV

8.2.2 Detailed Design Procedure

8.2.2.1 Custom Design With WEBENCH® Tools

Click here to create a custom design using the TPS61099 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

Copyright © 2026 Texas Instruments Incorporated

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

8.2.2.2 Programming the Output Voltage

There are two ways to set the output voltage of the TPS61099x. For adjustable output voltage version, select the external resistor divider R1 and R2, as shown in Equation 1, the output voltage is programmed to the desired value. When the output voltage is regulated, the typical voltage at the FB pin is V_{REF} of 1.0V.

$$V_{OUT} = V_{REF} \cdot \frac{R1 + R2}{R2} \tag{1}$$

For fixed output voltage versions, the FB pin must be connected to the GND. The TPS61099x offers diverse fixed voltage versions, refer to *Device Comparison Table* for version details.

In this example, 5V output is required to bias the memory LCD. For the best accuracy, the current following through R2 must be 100 times larger than FB pin leakage current. Changing R2 toward a lower value increases the robustness against noise injection. Changing R2 toward higher values reduces the FB divider current for achieving the highest efficiency at low load currents. 1MΩ and 249kΩ resistors are selected for R1 and R2 in this example. TI recommends high accuracy resistors for better output voltage accuracy.

8.2.2.3 Maximum Output Current

The maximum output capability of the TPS61099x is determined by the input to output ratio and the current limit of the boost converter. Equation 2 calculates the maximum output capability.

$$I_{OUT(max)} = \frac{V_{IN} \cdot (I_{LIM} - \frac{I_{LH}}{2}) \cdot \eta}{V_{OUT}} \tag{2}$$

where

- η is the conversion efficiency, use 85% for estimation
- I_{LH} is the current ripple value
- I_{LIM} is the switch current limit

Minimum input voltage, maximum boost output voltage and minimum current limit I_{LIM} must be used as the worst case condition for the estimation.

8.2.2.4 Inductor Selection

Because the selection of the inductor affects steady state operation, transient behavior, and loop stability, the inductor is the most important component in power regulator design. There are three important inductor specifications, inductor value, saturation current, and dc resistance (DCR).

The TPS61099x is optimized to work with inductor values between 1µH and 2.2µH. For best stability consideration, a 2.2µH inductor is recommended under Vout > 3.0V condition while choosing a 1µH inductor for applications under Vout ≤ 3.0V condition. Follow Equation 3 and Equation 4 to calculate the inductor peak current for the application. Depending on different load conditions, the TPS61099x works in continuous current mode or discontinuous mode. In different modes, the peak currents of the inductor are also different. Equation 3 provides an easy way to estimate whether the device works in CCM or DCM. As long as the Equation 3 is true, continuous current mode is typically established. Otherwise, discontinuous current mode is typically established.

$$\frac{V_{OUT} \cdot I_{OUT}}{V_{IN} \times \eta} > \frac{I_{LH}}{2} \tag{3}$$

Copyright © 2026 Texas Instruments Incorporated

The inductor current ripple I_{LH} is fixed by design. Therefore, Equation 4 calculates the peak inductor current.

$$I_{L,peak} = \frac{V_{OUT} \cdot I_{OUT}}{V_{IN} \times \eta} + \frac{I_{LH}}{2}; \quad \text{continuous current mode operation}$$
$$I_{L,peak} = I_{LH}; \quad \text{discontinuous current mode operation} \tag{4}$$

where

- $I_{L,peak}$ is the peak inductor current.

The inductor saturation current must be higher than the calculated peak inductor current. Table 8-2 lists the recommended inductors for TPS61099x device.

After choosing the inductor, Equation 5 calculates the estimated switching frequency *f* in continuous current mode. The switching frequency is not a constant value, which is determined by L, V_{IN} and V_{OUT}.

$$f = \frac{V_{IN} \cdot (V_{OUT} - V_{IN} \cdot \eta)}{L \cdot I_{LH} \cdot V_{OUT}} \tag{5}$$

Table 8-2. List of Inductors

VOUT [V](1)	INDUCTANCE [µH]	SATURATION CURRENT [A]	DC RESISTANCE [mΩ]	SIZE (L × W × H)	PART NUMBER	MANUFACTURER
> 3.0	2.2	1.95	80	2.5 × 2.0 × 1.2	74404024022	Würth Elektronik
	2.2	1.7	92	2.5 × 2.0 × 1.1	LQH2HPN2R2MJR	muRata
	2.2	1.45	163	2.0 × 1.6 × 1.0	VLS201610Cx-2R2M	TDK
≤ 3.0	1.0	2.6	37	2.5 × 2.0 × 1.2	74404024010	Würth Elektronik
	1.0	2.3	48	2.5 × 2.0 × 1.0	MLP2520W1R0MT0S1	TDK
	1.0	1.5	80	2.0 × 1.2 × 1.0	LQM21PN1R0MGH	muRata

8.2.2.5 Capacitor Selection

For best output and input voltage filtering, TI recommends low ESR X5R or X7R ceramic capacitors.

The input capacitor minimizes input voltage ripple, suppresses input voltage spikes and provides a stable system rail for the device. An input capacitor value of 10µF is normally recommended to improve transient behavior of the regulator and EMI behavior of the total power supply circuit. A ceramic capacitor placed as close as possible to the VIN and GND pins of the IC is recommended.

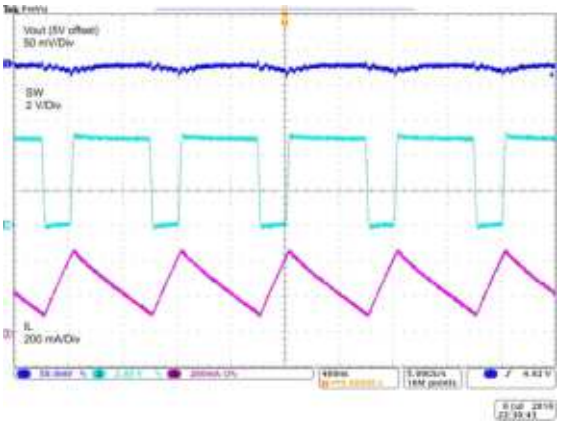

For the output capacitor of VOUT pin, TI recommends small ceramic capacitors placed as close as possible to the VOUT and GND pins of the IC. If, for any reason, the application requires the use of large capacitors which cannot be placed close to the IC, TI recommends the use of a small ceramic capacitor with a capacitance value of 1µF in parallel to the large one. This small capacitor must be placed as close as possible to the VOUT and GND pins of the IC.

From the power stage point of view, the output capacitor sets the corner frequency of the converter while the inductor creates a Right-Half-Plane-Zero. Consequently, with a larger inductor, a larger output capacitor must be used. The TPS61099x is optimized to work with the inductor from 1µH to 2.2µH, so the minimal output capacitor value is 20µF (nominal value). Increasing the output capacitor makes the output ripple smaller in PWM mode.

When selecting capacitors, ceramic capacitor derating effect under bias must be considered. Select the right nominal capacitance by checking the capacitor DC bias characteristics. In this example, GRM188R60J106ME84D, which is a 10µF ceramic capacitor with high effective capacitance value at DC biased condition, is selected for V_{OUT} rail. The performance of TPS61099x is shown in *Application Curves* section.

8.3 Power Supply Recommendations

The TPS61099x family is designed to operate from an input voltage supply range between 0.7V to 5.5V. The power supply can be alkaline battery, NiMH rechargeable battery, Li-Mn battery or rechargeable Li-Ion battery. The input supply must be well regulated with the rating of TPS61099x.

8.4 Layout

8.4.1 Layout Guidelines

As for all switching power supplies, the layout is an important step in the design, especially at high peak currents and high switching frequencies. If the layout is not carefully done, the regulator can show stability problems as well as EMI problems. Therefore, use wide and short traces for the main current path and for the power ground paths. The input and output capacitor, as well as the inductor must be placed as close as possible to the IC.

8.4.2 Layout Example

The bottom layer is a large GND plane connected by vias.

9 Device and Documentation Support

9.1 Device Support

9.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

9.1.2 Development Support

9.1.2.1 Custom Design With WEBENCH® Tools

Click here to create a custom design using the TPS61099x device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

9.2 Documentation Support

9.2.1 Related Documentation

For related documentation, see the following:

- Texas Instruments, *Performing Accurate Power Save Mode Efficiency Measurements* application note
- Texas Instruments, *Accurately measuring efficiency of ultralow-IQ devices* analog design journal
- Texas Instruments, *IQ: What it is, what it isn't, and how to use it* analog design journal

9.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

9.4 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

9.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9.7 Glossary

TI Glossary — This glossary lists and explains terms, acronyms, and definitions.

10 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision L (August 2021) to Revision M (August 2026)	Page
• Added start-up description in *Soft Start*	11

Changes from Revision K (May 2018) to Revision L (August 2021)	Page
• Updated the numbering format for tables, figures and cross-references throughout the document.	1

Changes from Revision J (October 2017) to Revision K (May 2018)	Page
• Added Load Efficiency graph for TPS610995 device	7

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. (1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

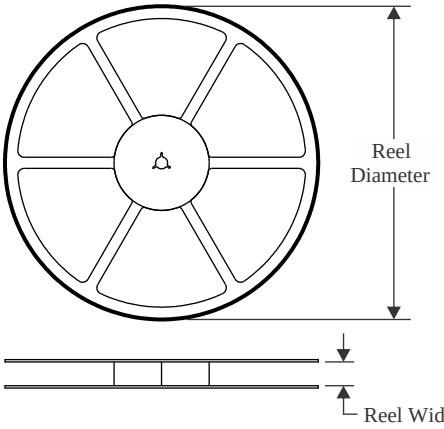

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

GENERIC PACKAGE VIEW

DRV 6 WSON - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

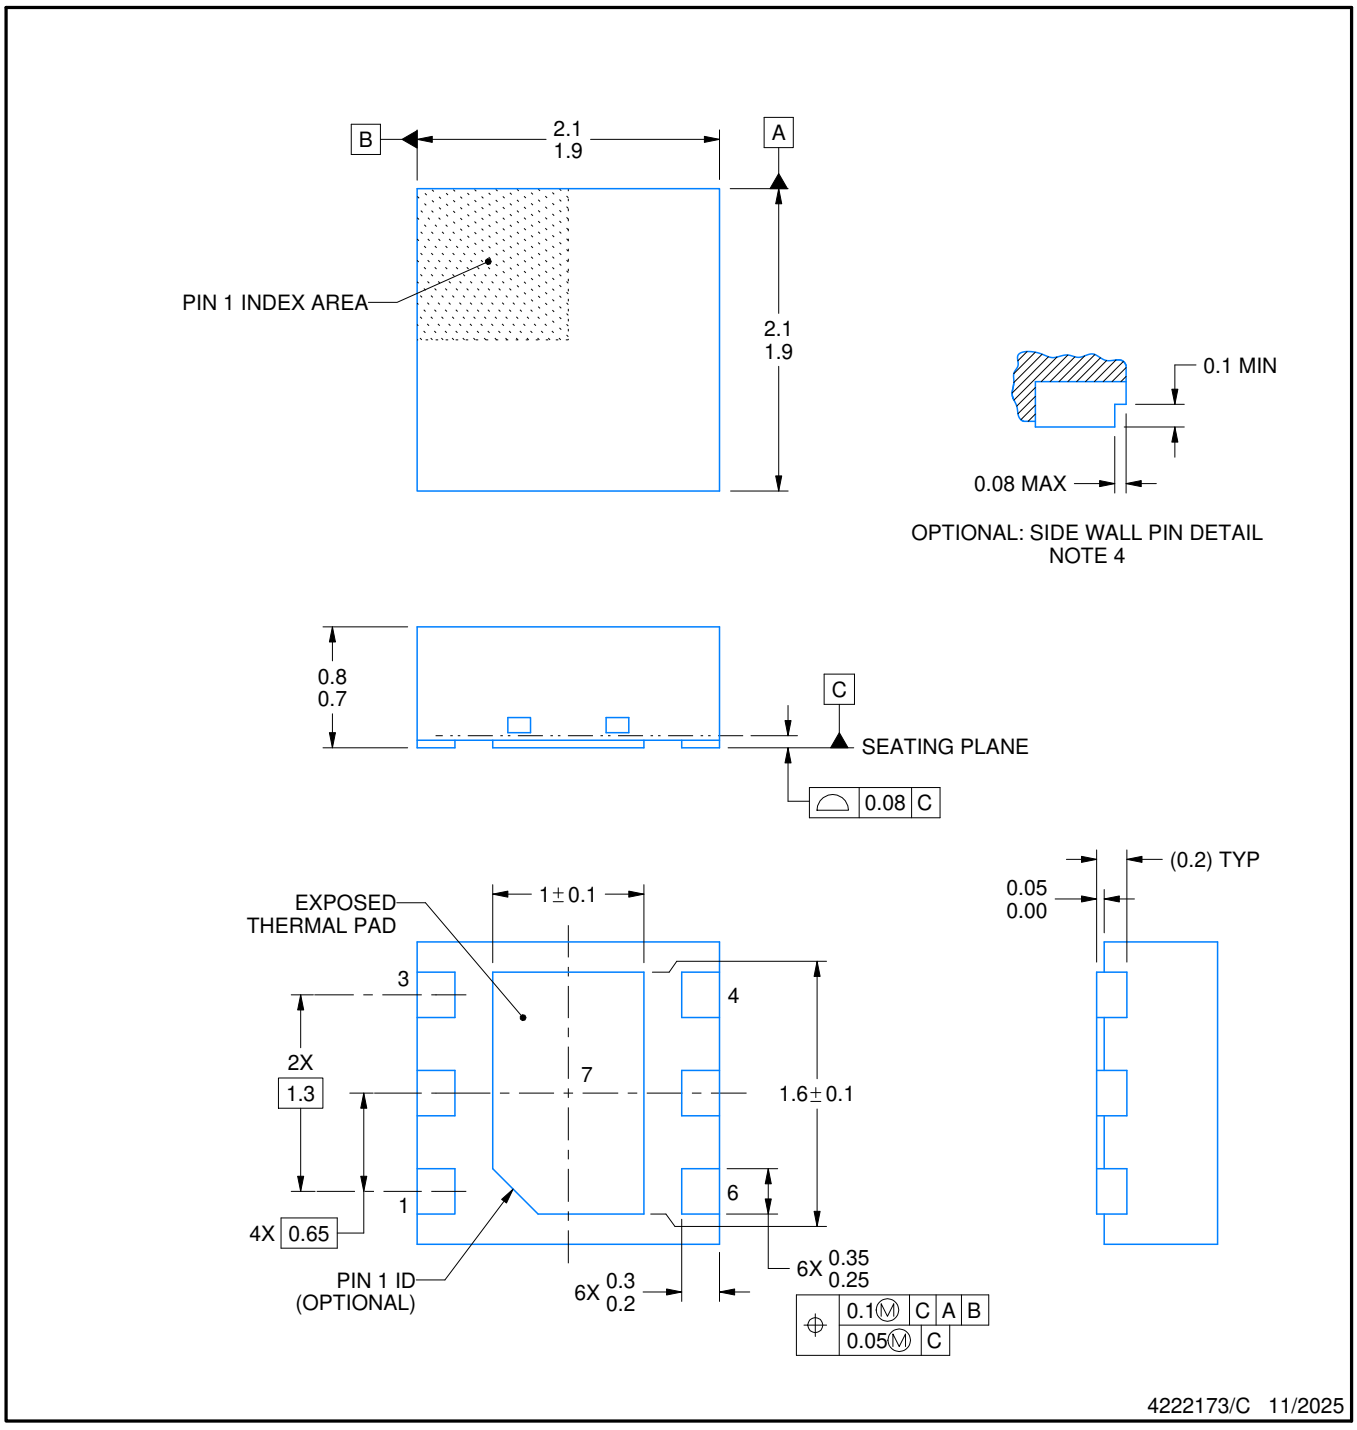

DRV0006A

PACKAGE OUTLINE

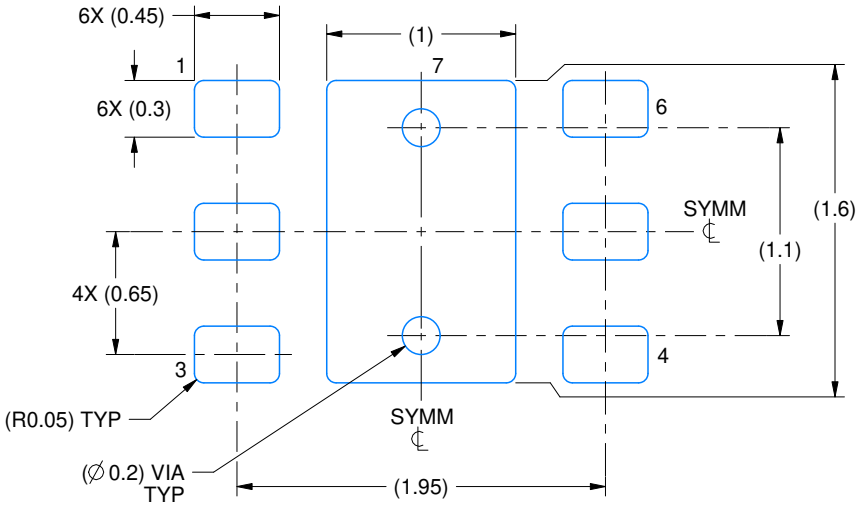

WSON - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

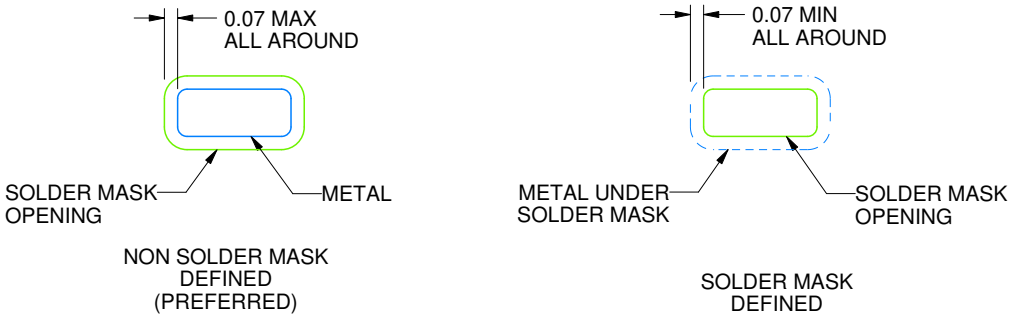

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.
4. Minimum 0.1 mm solder wetting on pin side wall. Available for wettable flank version only.

LAND PATTERN EXAMPLE
SCALE:25X

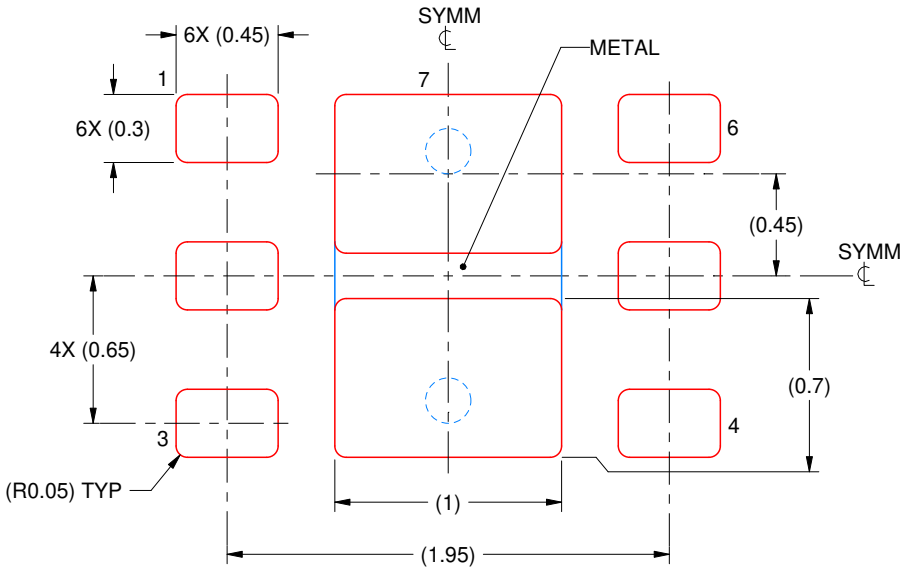

SOLDER MASK DETAILS

4222173/C 11/2025

NOTES: (continued)

5. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
6. Vias are optional depending on application, refer to device data sheet. If some or all are implemented, recommended via locations are shown.

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD #7
88% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE
SCALE:30X

4222173/C 11/2025

NOTES: (continued)

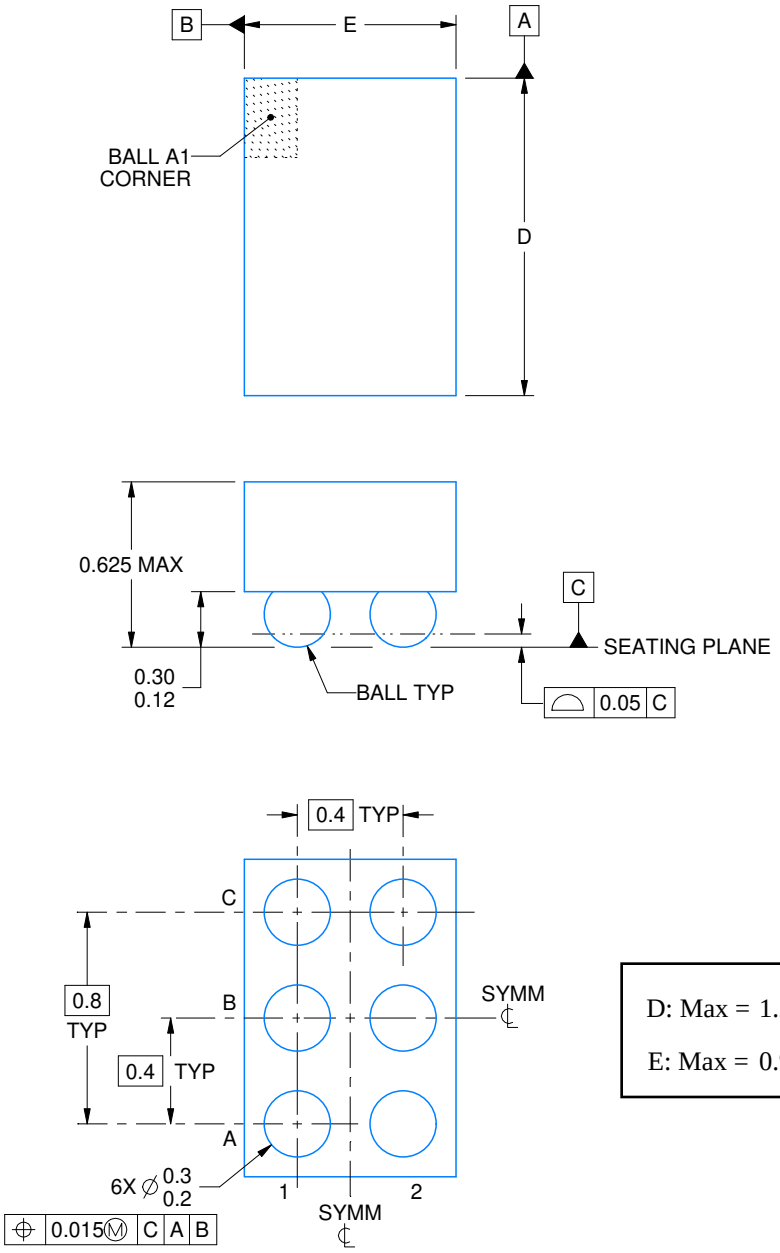

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
