

Dual 250 mA Output, UltraLow Noise, High PSRR, Low-Dropout Linear Regulator with Integrated SVS

FEATURES

- **Dual 250 mA High-Performance RF LDOs**
- **Integrated Supply Voltage Supervisor Monitors V_{OUT2}**
- **Available in Fixed and Adjustable Voltage Options (1.2 V to 5.5 V)**
- **High PSRR: 65 dB at 10 kHz**
- **UltraLow Noise: 32 µVrms**
- **Fast Start-Up Time: 60 µs**
- **Stable with 2.2 µF Ceramic Capacitor**
- **Excellent Load/Line Transient Response**
- **Very Low Dropout Voltage: 125 mV at 250 mA**
- **Independent Enable Pins**
- **Thermal Shutdown and Independent Current Limit**
- **Available in Thermally-Enhanced SON Package: 3mm x 3mm x 1mm**

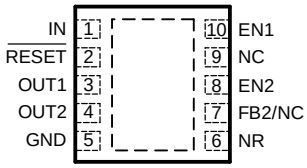

APPLICATIONS

- **Cellular and Cordless Phones**
- **Wireless PDA/Handheld Products**
- **PCMCIA/Wireless LAN Applications**
- **Digital Camera/Camcorder/Internet Audio**
- **DSP/FPGA/ASIC/Controllers and Processors**

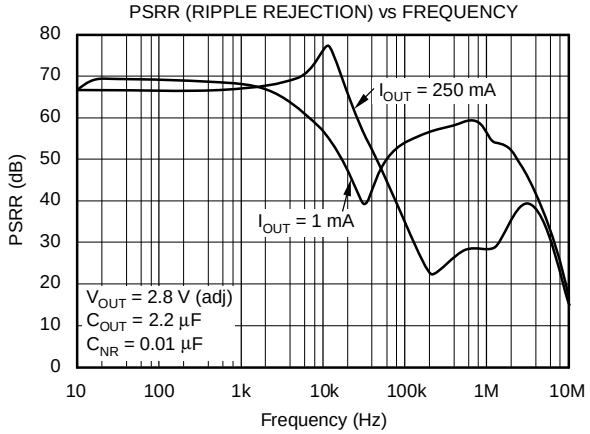

DESCRIPTION

The TPS713xx family of low-dropout (LDO) voltage regulators is tailored to noise-sensitive and RF applications. These products feature dual 250 mA LDOs with ultralow noise, high power-supply rejection ratio (PSRR), and fast transient and start-up response. These devices also feature an integrated supply voltage supervisor (SVS) that monitors the voltage at OUT2 and will assert if the voltage falls to 95% (typical) of the measured output. Each regulator output is stable with low-cost 2.2 µF ceramic output capacitors and features very low dropout voltages (125 mV typical at 250 mA). Each regulator achieves fast start-up times (approximately 60 µs with a 0.001 µF bypass capacitor) while consuming very low quiescent current (300 µA typical with both outputs enabled). When the device is placed in standby mode, the supply current is reduced to less than 0.3 µA typical. Each regulator exhibits approximately 32 µVrms of output voltage noise with V_{OUT} = 2.8 V and a 0.01 µF noise reduction (NR) capacitor. Applications with analog components that are noise-sensitive, such as portable RF electronics, will benefit from high PSRR, low noise, and fast line and load transient features. The TPS713xx family is offered in a thin 3mm x 3mm SON package and is fully specified from -40°C to +125°C (T_J).

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ELECTRICAL CHARACTERISTICS

Over operating temperature range (T_J = -40°C to +125°C), V_{IN} = highest $V_{OUT(nom)}$ + 1.0 V or 2.7 V (whichever is greater), I_{OUT} = 1 mA, $V_{EN1, 2}$ = 1.2 V, C_{OUT} = 10 µF, C_{NR} = 0.01 µF, and adjustable LDOs are tested at V_{OUT} = 3.0 V, unless otherwise noted. Typical values are at T_J = 25°C.

PARAMETER			TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{IN}	Input voltage range(1)			2.7		5.5	V
V_{FB}	Internal reference (adjustable LDOs)			1.200	1.225	1.250	V
V_{OUT}	Output voltage range (adjustable LDOs)			V_{FB}		5.5 - V_{DO}	V
	Accuracy(1)	Nominal	T_J = 25°C, I_{OUT} = 0 mA	-1.5		+1.5	%
		Over V_{IN}, I_{OUT}, and T	V_{OUT} + 1.0 V ≤ V_{IN} ≤ 5.5 V, 0 µA ≤ I_{OUT} ≤ 250 mA	-3	±1	+3	
$\Delta V_{OUT}\%/\Delta V_{IN}$	Line regulation(1)		V_{OUT} + 1.0 V ≤ V_{IN} ≤ 5.5 V		0.05		%/V
$\Delta V_{OUT}\%/\Delta I_{OUT}$	Load regulation		0 µA ≤ I_{OUT} ≤ 250 mA		0.8		%/mA
V_{DO}	Dropout voltage(2) (V_{IN} = $V_{OUT(nom)}$ - 0.1V)	2.8 V, 2.85 V Adjustable	I_{OUT1} = I_{OUT2} = 250 mA		125	230	mV
I_{CL}	Output current limit		V_{OUT} = 0.9 × $V_{OUT(nom)}$	400	600	800	mA
I_{GND}	Ground pin current	One LDO enabled	I_{OUT} = 1 mA (enabled channel)		190	250	µA
		Both LDOs enabled	I_{OUT1} = I_{OUT2} = 1 mA to 250 mA		300	600	
I_{SHDN}	Shutdown current(3)		V_{EN} ≤ 0.4 V, 0 V ≤ V_{IN} ≤ 5.5 V, $\overline{RESET}$ open		0.3	2.0	µA
I_{FB}	FB pin current (adjustable LDOs)				0.1	1	µA
V_n	Output noise voltage, BW = 10 Hz - 100 kHz		No C_{NR}, I_{OUT} = 250 mA		80.0 × V_{OUT}		µVrms
			C_{NR} = 0.01 µF, I_{OUT} = 250 mA		11.8 × V_{OUT}		
PSRR	Power-supply rejection ratio (ripple rejection)		f = 100 Hz, I_{OUT} = 250 mA		65		dB
			f = 10 kHz, I_{OUT} = 250 mA		65		
t_{STR}	Startup time		V_{OUT} = 2.85 V, R_L = 30Ω, C_{NR} = 0.001 µF		60		µs
V_{IH}	Enable threshold high (EN1, EN2)			1.2		V_{IN}	V
V_{IL}	Enable threshold low (EN1, EN2)			0		0.4	V
I_{EN}	Enable pin current (EN1, EN2)		V_{IN} = V_{EN} = 5.5 V	-1		1	µA
	Minimum V_{IN} for valid $\overline{RESET}$		$I_{\overline{RESET}}$ = 10 µA		0.6		V
$V_{\overline{RESET}, LO}$	$\overline{RESET}$ output low voltage		$I_{\overline{RESET}}$ = 1 mA			0.4	V
$I_{LKG, RESET}$	$\overline{RESET}$ leakage current		V_{IN} = V_{RESET} = 5.5 V		10	500	nA
V_{IT}	$\overline{RESET}$ threshold voltage		V_{OUT2} falling(4)	92.5		97.5	$\%V_{OUT}$
V_{HYS}	$\overline{RESET}$ threshold hysteresis		V_{OUT2} rising(4)		0.5		$\%V_{OUT}$
T_D	$\overline{RESET}$ delay time			50	100	200	ms
T_P	$\overline{RESET}$ propagation delay				10		µs
T_{SD}	Thermal shutdown temperature		Shutdown Temp increasing		+160		°C
			Reset Temp decreasing		+140		
UVLO	Under-voltage lockout threshold		V_{IN} rising	2.25		2.65	V
	Under-voltage lockout hysteresis		V_{IN} falling		100		mV

(1) Minimum V_{IN} = V_{OUT} + V_{DO} or 2.7 V, whichever is greater.
(2) V_{DO} is not measured for 1.8 V regulators since minimum V_{IN} = 2.7 V.
(3) For the adjustable version, this applies only after V_{IN} is applied; then V_{EN} transitions from high to low.
(4) $\overline{RESET}$ threshold and hysteresis is a percentage of the measured output.

FUNCTIONAL BLOCK DIAGRAM

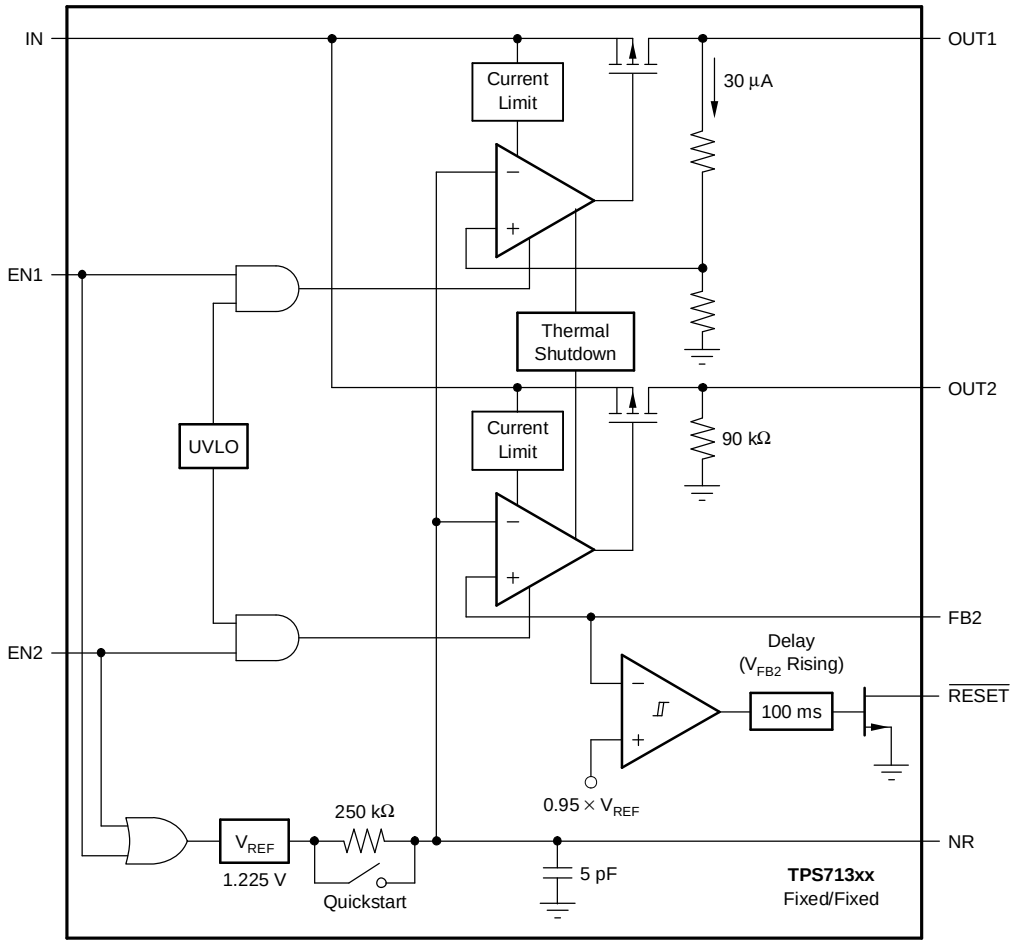

Table 1. TERMINAL FUNCTIONS

TERMINAL		DESCRIPTION
NAME	DRC	
IN	1	Unregulated input supply. A 0.1 µF capacitor should be connected from IN to GND.
GND	5, Pad	Ground
OUT1	3	Output of the regulator. A small 2.2 µF ceramic capacitor is required from this pin to ground to assure stability.
OUT2	4	Same as OUT1 but for LDO2.
EN1	10	Driving the enable pin (EN) high turns on LDO1. Driving this pin low puts LDO1 into shutdown mode, reducing operating current. The enable pin should be connected to IN if not used.
EN2	8	Same as EN1 but controls LDO2.
NC	9	No connection.
FB2/NC	7	Feedback for CH2 adjustable version; no connection for non-adjustable CH2.
NR	6	Noise reduction pin; connect an external bypass capacitor to reduce LDO output noise.
$\overline{\text{RESET}}$	2	Open-drain reset output; monitors OUT2. A 10 kΩ to 1 MΩ pull-up resistor is suitable for most applications. The open-drain $\overline{\text{RESET}}$ pull-up voltage should not exceed V_{DD} + 0.3 V.

TYPICAL CHARACTERISTICS

For all voltage versions at T_J = 25°C, V_{IN} = $V_{OUT(nom)}$ + 1 V, I_{OUT} = 1 mA, V_{EN} = 1.2 V, C_{OUT} = 2.2 µF, and C_{NR} = 0.01 µF, unless otherwise noted.

APPLICATION INFORMATION

The TPS713xx family of dual low-dropout (LDO) regulators has been optimized for use in noise-sensitive battery-operated equipment. The device features extremely low dropout, high PSRR, ultralow output noise, and low quiescent current (190 µA typically per channel). When both outputs are disabled, the supply currents are reduced to less than 2µA. A typical application circuit with sequencing is shown in Figure 24.

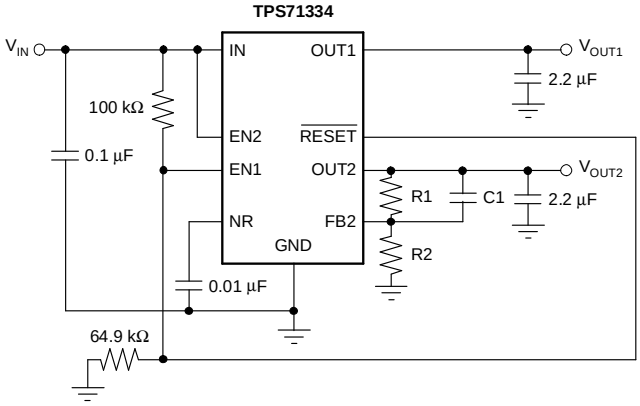

Figure 24. Typical Application Circuit (with output sequencing)

INPUT AND OUTPUT CAPACITOR REQUIREMENTS

A 0.1 µF or larger ceramic input bypass capacitor, connected between IN and GND and located close to the TPS713xx, is required for stability. It improves transient response, noise rejection, and ripple rejection. A higher-value input capacitor may be necessary if large, fast-rise-time load transients are anticipated and the device is located several inches from the power source.

The TPS713xx requires an output capacitor connected between the outputs and GND to stabilize the internal control loops. The minimum recommended output capacitor is 2.2 µF. If an output voltage of 1.8 V or less is chosen, the minimum recommended output capacitor is 4.7 µF. Any ceramic capacitor that meets the minimum output capacitor requirements is suitable. Capacitors with higher ESR may be used, provided the worst-case ESR is less than 1Ω.

OUTPUT NOISE

The internal voltage reference is a key source of noise in an LDO regulator. The TPS713xx has an NR pin that is connected to the voltage reference through a 250 kΩ internal resistor. The 250 kΩ internal resistor, in conjunction with an external ceramic bypass capacitor connected to the NR pin, creates a low-pass filter to reduce the voltage reference noise and, therefore, the noise at the regulator output. To achieve a fast startup, the 250 kΩ internal resistor is shorted for 400 µs after the device is enabled.

Because the primary noise source is the internal voltage reference, the output noise will be greater for higher output voltage versions. For the case where no noise reduction capacitor is used, the typical noise (µVrms) over 10 Hz to 100 kHz is 30 times the output voltage. If a 0.01 µF capacitor is used from the NR pin to ground, the noise (µVrms) drops to 11.8 times the output voltage. For example, the TPS71334 with the adjustable output set to 2.8 V exhibits only 33 µVrms of output voltage noise using a 0.01 µF ceramic bypass capacitor and a 2.2 µF ceramic output capacitor.

STARTUP CHARACTERISTICS

To minimize startup overshoot, the TPS713xx will initially target an output voltage that is approximately 80% of the final value. To avoid a delayed startup time, noise reduction capacitors of 0.01 µF or less are recommended. Larger noise reduction capacitors will cause the output to hold at 80% until the voltage on the noise reduction capacitor exceeds 80% of the bandgap voltage. The typical startup time with a 0.001 µF noise reduction capacitor is 60 µs. Once one of the output voltages is present, the startup time of the other output will not be affected by the noise reduction capacitor.

PROGRAMMING THE TPS71202 ADJUSTABLE LDO REGULATOR

The output voltage of the TPS71202 dual adjustable regulator is programmed using an external resistor divider, as shown in Figure 24. The output voltage is calculated using Equation 1:

$$V_{OUT} = V_{REF} \times \left(1 + \frac{R1}{R2}\right) \quad (1)$$

where V_{REF} = 1.225 V (the internal reference voltage).

Resistors R2 and R4 should be chosen for approximately a 40 µA divider current. Lower value resistors can be used for improved noise performance, but will consume more power. Higher values should be avoided because leakage current at FB increases the output voltage error. The recommended design procedure is to choose R2 = 30.1 kΩ to set the divider current at 40 µA, and then calculate R1 using Equation 2:

$$R1 = \left(\frac{V_{OUT}}{V_{REF}} - 1\right) \times R2 \quad (2)$$

To improve the stability and noise performance of the adjustable version, a small compensation capacitor can be placed between OUT and FB.

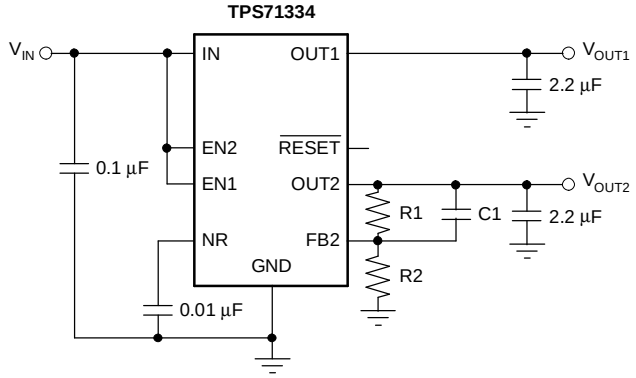

For voltages ≤ 1.8 V, the value of this capacitor should be 100 pF. For voltages > 1.8 V, the approximate value of this capacitor can be calculated as Equation 3:

$$C1 = \frac{(3 \times 10^5) \times (R1 + R2)}{(R1 \times R2)} (pF) \quad (3)$$

The suggested value of this capacitor for several resistor ratios is shown in Figure 25. If this capacitor is not used (such as in a unity-gain configuration) or if an output voltage ≤ 1.8 V is chosen, then the minimum recommended output capacitor is 4.7 µF instead of 2.2 µF.

DROPOUT VOLTAGE

The TPS713xx uses a PMOS pass transistor to achieve extremely low dropout. When (V_{IN} - V_{OUT}) is less than the dropout voltage (V_{DO}), the PMOS pass device is in its linear region of operation and the input-to-output resistance is the $R_{DS, ON}$ of the PMOS pass element. Dropout voltages at lower currents can be approximated by calculating the effective $R_{DS, ON}$ of the pass element and multiplying that resistance by the load current. $R_{DS, ON}$ of the pass element can be obtained by dividing the dropout voltage by the rated output current. For the TPS71334, the $R_{DS, ON}$ of the pass element is 84 mΩ. The dropout voltage of the TPS713xx will be less for higher output voltage versions. This is because the PMOS pass element will have lower on-resistance due to increased gate drive.

Output Voltage Programming Guide

V_{OUT2}	R1	R2	C1
1.225 V	Short	Open	Open
1.5 V	7.15 kΩ	30.1 kΩ	100 pF
2.5 V	31.6 kΩ	30.1 kΩ	22 pF
3.0 V	43.2 kΩ	30.1 kΩ	15 pF
3.3 V	49.9 kΩ	30.1 kΩ	15 pF
4.75 V	86.6 kΩ	30.1 kΩ	15 pF

Figure 25. TPS71334 Adjustable LDO Regulator Programming

SUPERVISOR DESCRIPTION

The TPS713xx has an on-chip supply voltage supervisor (SVS) that monitors the voltage at OUT2. The $\overline{\text{RESET}}$ output will assert if V_{OUT2} is below the reset threshold (V_{IT}). When OUT2 exceeds the reset threshold plus hysteresis (V_{HYS}), the $\overline{\text{RESET}}$ output will remain low for the specified delay time (t_D). When OUT2 is disabled by EN2 or the input voltage is below the under-voltage lockout (UVLO), the reset signal is automatically asserted. The functionality of the reset circuit is shown in Figure 26 and Table 2.

The output accuracy or output divider resistor tolerances have minimal effect on the relative V_{IT} threshold accuracy. The reset threshold V_{IT} will scale accordingly to the actual output voltage. The $\overline{\text{RESET}}$ output will remain unasserted during transients shorter than the reset circuit propagation delay (T_P). Even with a 2.2 µF output capacitor, typical load transient conditions will not cause $\overline{\text{RESET}}$ to falsely assert.

The $\overline{\text{RESET}}$ pin requires an external resistor to pull the pin high during the unasserted state. A 10 kΩ to 1 MΩ resistor is suitable for most applications. If the resistance is too low, the pin may not pull low enough to be recognized as a valid logic signal. If the pull-up resistor is too large, the reset pin leakage may cause the device not to pull high enough in the unasserted state. The pull-up voltage for the $\overline{\text{RESET}}$ pin should not exceed V_{IN} + 0.3 V; doing so will turn on internal ESD protection devices and may damage the device.

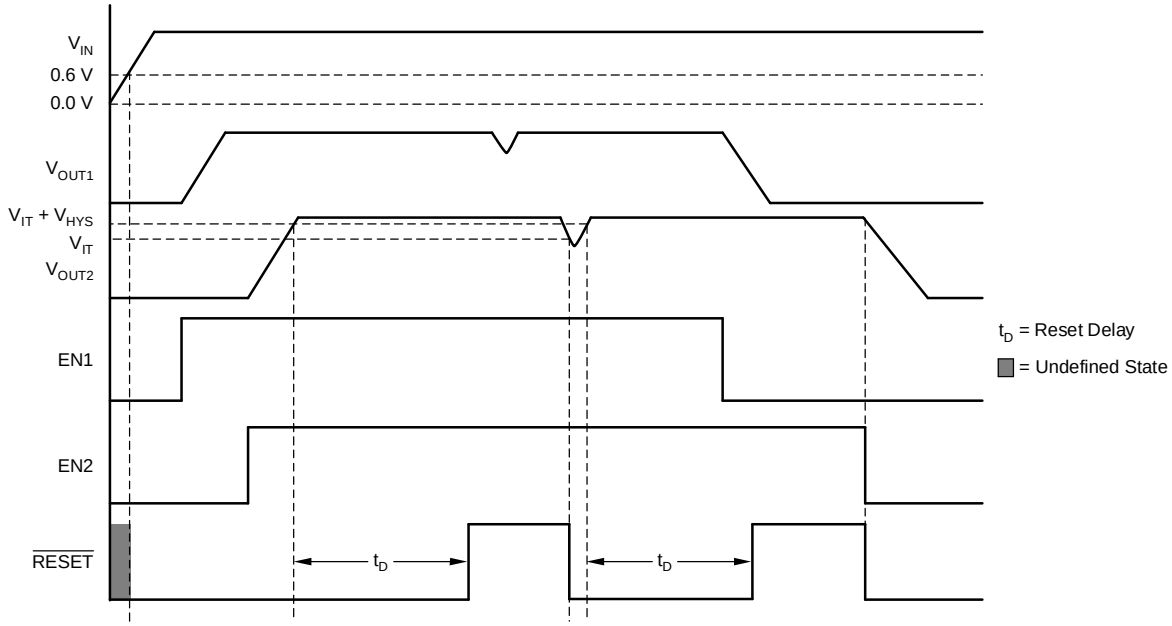

Figure 26. $\overline{\text{RESET}}$ Timing Diagram

Table 2. Reset Pin Truth Table

EN2	UVLO Asserted	V_{OUT2}	$\overline{\text{RESET}}$ Asserted
X(1)	Yes	X	Yes
Low	X	X	Yes
High	No	$V_{OUT2} > V_{IT}$	No
High	No	$V_{OUT2} < V_{IT}$	Yes

(1) X = don't care.

TRANSIENT RESPONSE

As with any regulator, increasing the size of the output capacitor will reduce over/undershoot magnitude but increase duration of the transient response. In the adjustable version, the addition of a capacitor, C_{FB}, from the output to the feedback pin will also improve stability and transient response. The transient response of the TPS713xx is enhanced with an active pull-down that engages when the output is over-voltaged. The active pull-down decreases the output recovery time when the load is removed. Figure 14 in the Typical Characteristics section shows the output transient response.

SHUTDOWN

Both enable pins are active high and are compatible with standard TTL-CMOS levels. The device is only completely disabled when both EN1 and EN2 are logic low. In this state, the LDO is completely off and the ground pin current drops to approximately 100 nA. With one output disabled, the ground pin current is slightly greater than half the nominal value. When shutdown capability is not required, the enable pins should be connected to the input supply.

INTERNAL CURRENT LIMIT

The TPS713xx internal current limit helps protect the regulator during fault conditions. During current limit, the output will source a fixed amount of current that is largely independent of the output voltage.

The TPS713xx PMOS-pass transistors have a built-in back diode that conducts reverse current when the input voltage drops below the output voltage (that is, during power-down). Current is conducted from the output to the input and is not internally limited. If extended reverse voltage operation is anticipated, external limiting may be appropriate.

THERMAL PROTECTION

Thermal protection disables both outputs when the junction temperature of either channel rises to approximately +160°C, allowing the device to cool. When the junction temperature cools to approximately +140°C, the output circuitry is again enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This limits the dissipation of the regulator, protecting it from damage due to overheating.

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heatsink. For reliable operation, junction temperature should be limited to +125°C maximum. To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, thermal protection should trigger at least +35°C above the maximum expected ambient condition of your application. This produces a worst-case junction temperature of +125°C at the highest expected ambient temperature and worst-case load.

The internal protection circuitry of the TPS713xx was designed to protect against overload conditions. It was not intended to replace proper heatsinking. Continuously running the TPS713xx into thermal shutdown will degrade device reliability.

POWER DISSIPATION

The ability to remove heat from the die is different for each package type, presenting different considerations in the PCB layout. The PCB area around the device that is free of other components moves the heat from the device to the ambient air. Performance data for a JEDEC high-K board is shown in the Dissipation Ratings table. Using heavier copper will increase the effectiveness in removing heat from the device. The addition of plated through-holes to heat-dissipating layers will also improve the heat-sink effectiveness.

Power dissipation depends on input voltage and load conditions. Power dissipation is equal to the product of the output current times the voltage drop across the output pass element (V_{IN} to V_{OUT}):

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (4)$$

Power dissipation can be minimized by using the lowest possible input voltage necessary to assure the required output voltage.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

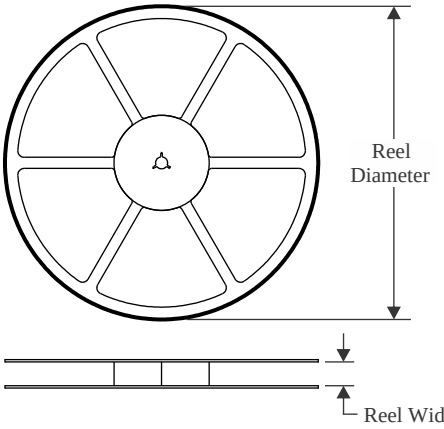

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative

and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

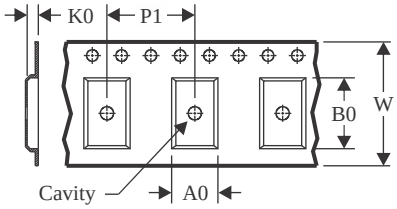

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

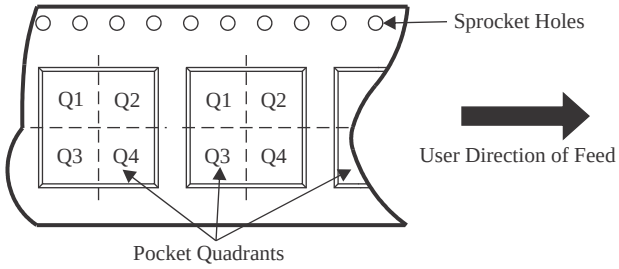

TAPE DIMENSIONS

A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

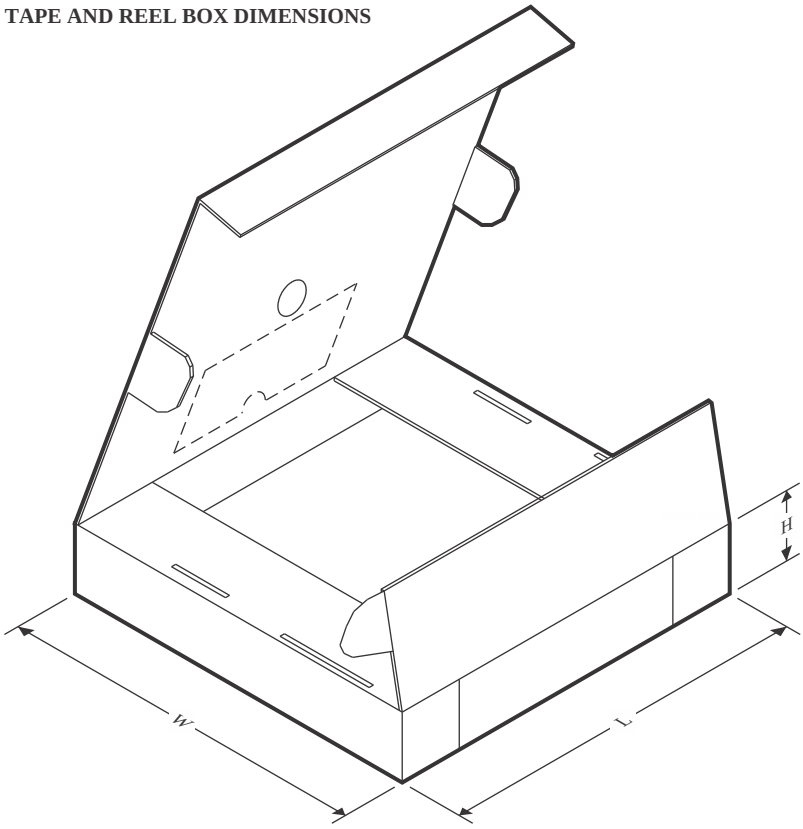

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

PACKAGE OUTLINE

DRC0010K

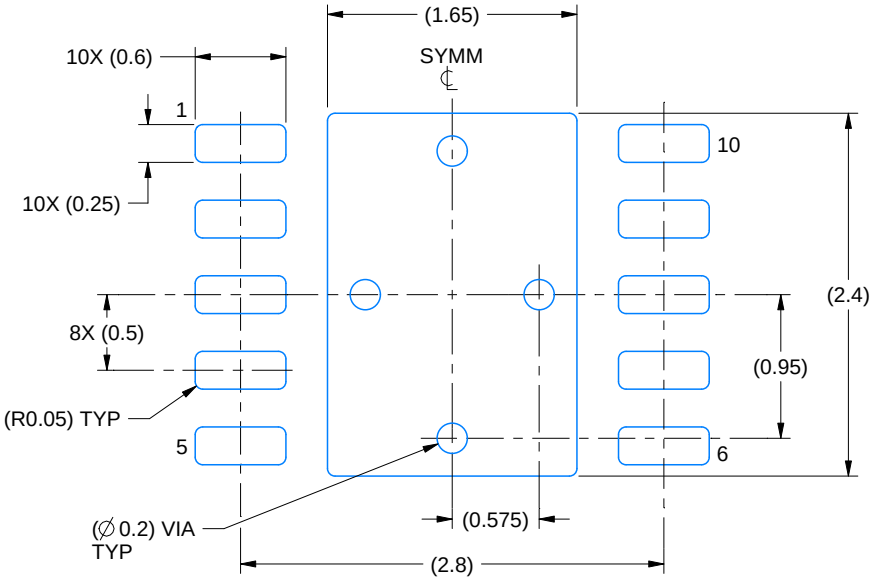

VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

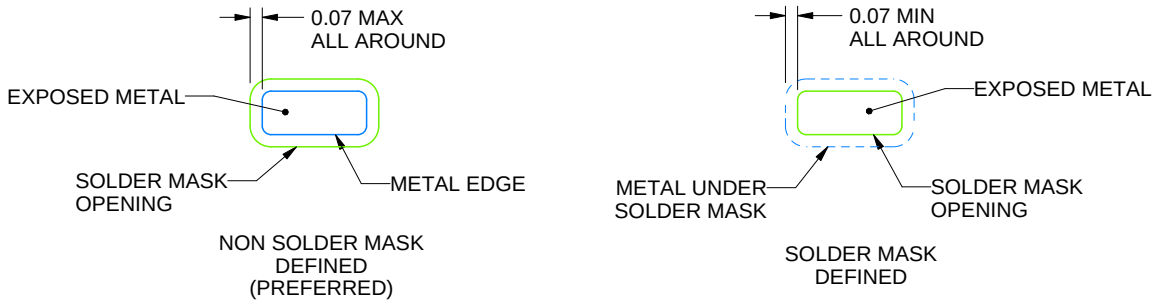

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:20X

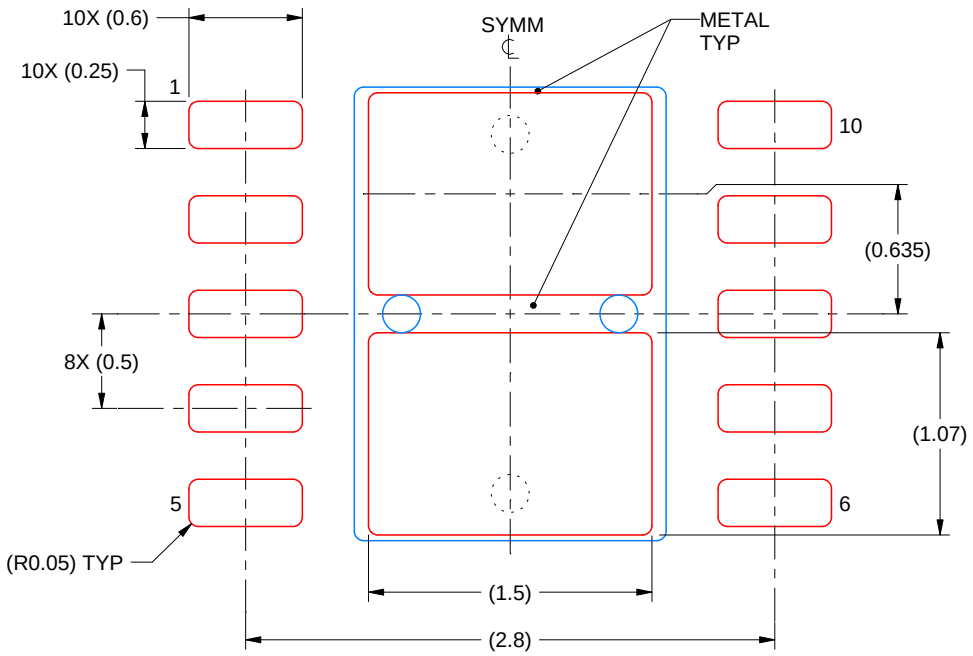

SOLDER MASK DETAILS

4222059/B 02/2018

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD
81% PRINTED SOLDER COVERAGE BY AREA
SCALE:25X

4222059/B 02/2018

NOTES: (continued)

5. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES “AS IS” AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI’s products are provided subject to TI’s Terms of Sale, TI’s General Quality Guidelines, or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI’s provision of these resources does not expand or otherwise alter TI’s applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
